

## How to use the 15 kW three-level three-phase Vienna rectifier with digital control for power factor correction

### Introduction

The **STDES-VRECTFD** reference design represents a complete solution for high-power, three-phase active front end (AFE) rectifier applications based on the three-level Vienna topology.

This reference design topology is mostly used for DC fast charging applications related to industrial and electric vehicles.

It features full digital control. The embedded **STM32G474RET3** mixed-signal high-performance microcontroller provides the full control of the power factor (PF), the DC voltage, and the auxiliary task to manage the protections and the soft start-up procedure.

The high-bandwidth continuous conduction mode (CCM) current regulation allows the maximum power quality in terms of total harmonic distortion (THD) and power factor (PF).

**Figure 1. DC charging station**

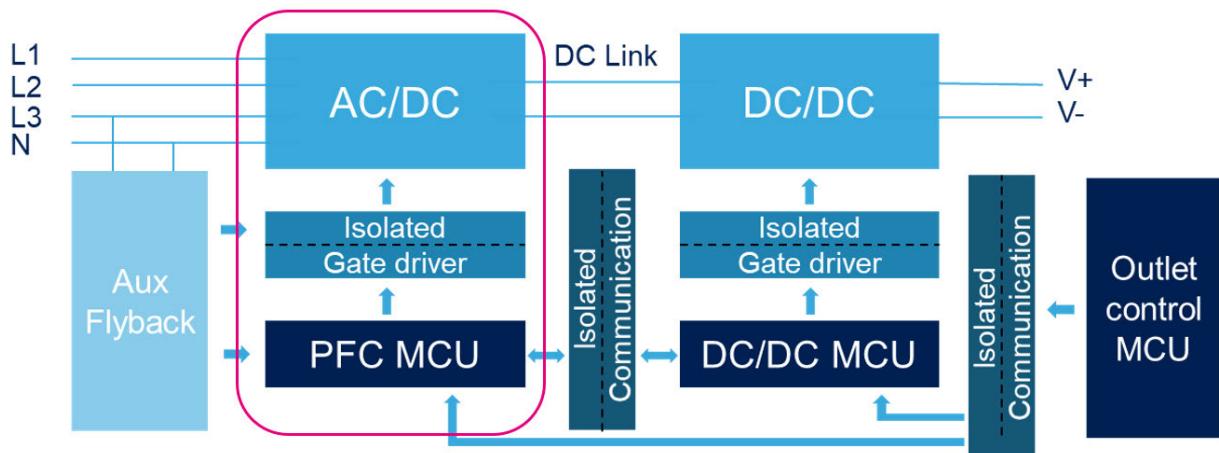

Figure 2. STDES-VRECTFD reference design - power board

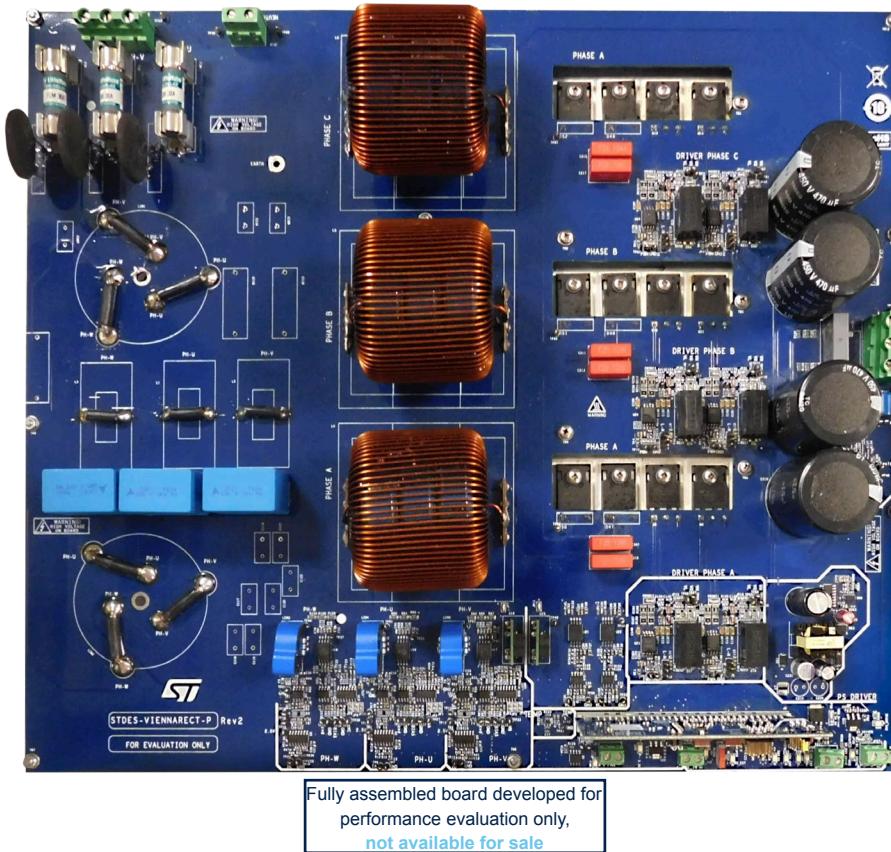

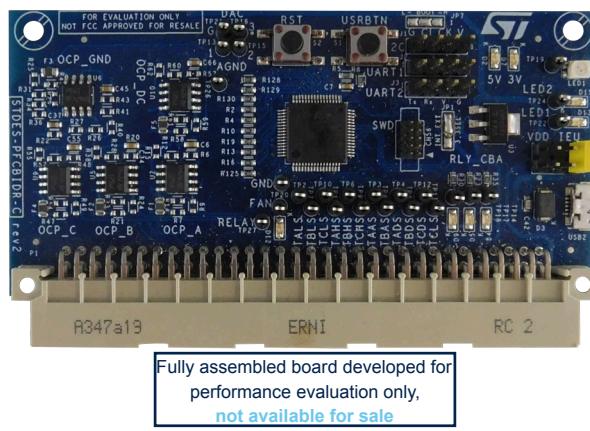

Figure 3. STDES-VRECTFD reference design - control board

The high switching frequency of the SiC MOSFETs (70 kHz) and the multilevel structure allow an efficiency of almost 99% as well as the optimization of passive power components in terms of size and cost.

The high efficiency rectifier is designed for several end applications such as electric vehicle (EV), industrial battery chargers, and industrial equipment, which requires a very high PF and low THD.

The STDES-VRECTFD is a fully assembled kit developed for performance evaluation only, not available for sale.

# 1 Getting started

## 1.1 Safety information

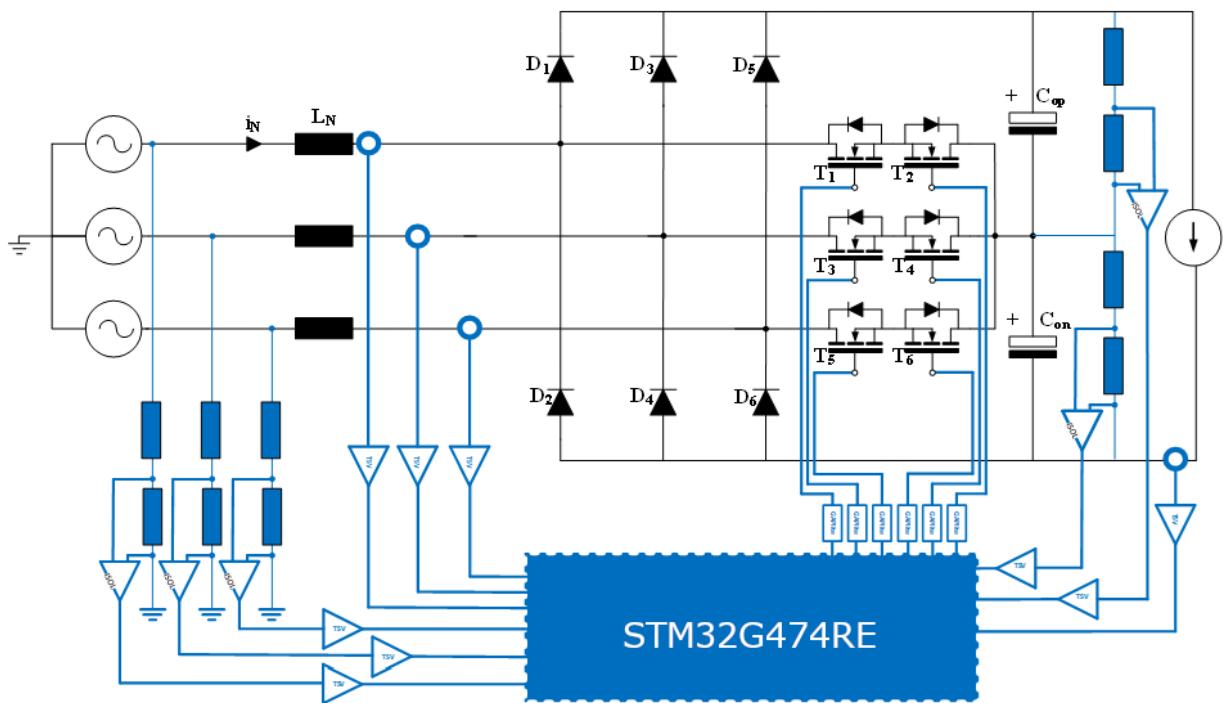

**Caution:** This reference design is intended for demonstration purposes only and is not for domestic or industrial installations.

**Danger:** *The high-voltage levels used to operate the reference design can cause serious injury, electrical shock, and even death.*

*This reference design is intended for use by experienced power electronics professionals who understand the necessary precautions against potential dangers and risks while operating this board, even when it is not powered. The qualified personnel must be familiar with the installation, use, and maintenance of power electrical systems. During operation, do not touch the board as some of its components could reach a very high temperature.*

## 1.2 Block diagram

Figure 4. STDES-VRECTFD block diagram

## 1.3 Features

- Three-phase, three-level AC-DC power converter
  - Nominal rate for DC voltage: 800 V<sub>DC</sub>
  - Nominal rate for AC voltage: 400 V<sub>AC</sub> at 50 Hz
  - Maximum power: 15 kW
  - Power factor: >0.99
  - Inrush current control and soft start-up
  - THD lower than 5% at nominal operation

- Power section based on SiC MOSFETs and SiC diodes:
  - High frequency operation (70 kHz)
  - High efficiency: >98.6%
  - Passive element weight and size reduction
- Control section based on the [STM32G474RET3](#) microcontroller:
  - Control and monitoring interfaces: SWD-UART, I<sup>2</sup>C and DACs
  - 64-pin digital power connector
  - LED status as UI
  - Four integrated high-performance op-amps for additional features

## 1.4 Main characteristics

**Table 1. Main characteristics**

Description	Symbol	Min.	Typ.	Max.	Unit	Comments
Three-phase input voltage	V <sub>AC</sub>	208		480	V <sub>ACLL</sub>	
AC line frequency	Hz	47		63	Hz	
Maximum output power	P <sub>OUTmax</sub>		15		kW	V <sub>AC</sub> = 230 V <sub>RMS</sub> I <sub>AC</sub> = 21 V <sub>RMS</sub> V <sub>AC</sub> = 110 V <sub>RMS</sub> I <sub>AC</sub> = 21 V <sub>RMS</sub>
Output voltage	V <sub>DC</sub>		800		V	
Power factor	PF		>0.99		-	From 20% of load
Total harmonic distortion	THDi		<5		%	From 20% of load
Switching frequency	f <sub>sw</sub>		70		kHz	

**Table 2. Protection characteristics**

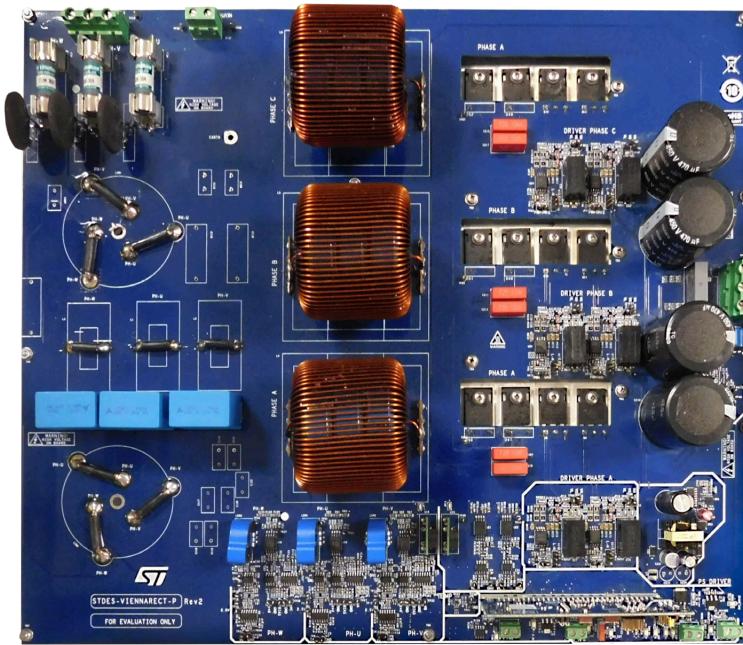

Description	Symbol	Min.	Typ.	Max.	Unit
HVDC overvoltage protection	V <sub>DCovp</sub>			900	V
HVCAP overvoltage protection	V <sub>CAPovp</sub>			500	V
AC overcurrent protection	I <sub>ACovp</sub>			30	A

## 1.5 Reference design description

### 1.5.1 Power board

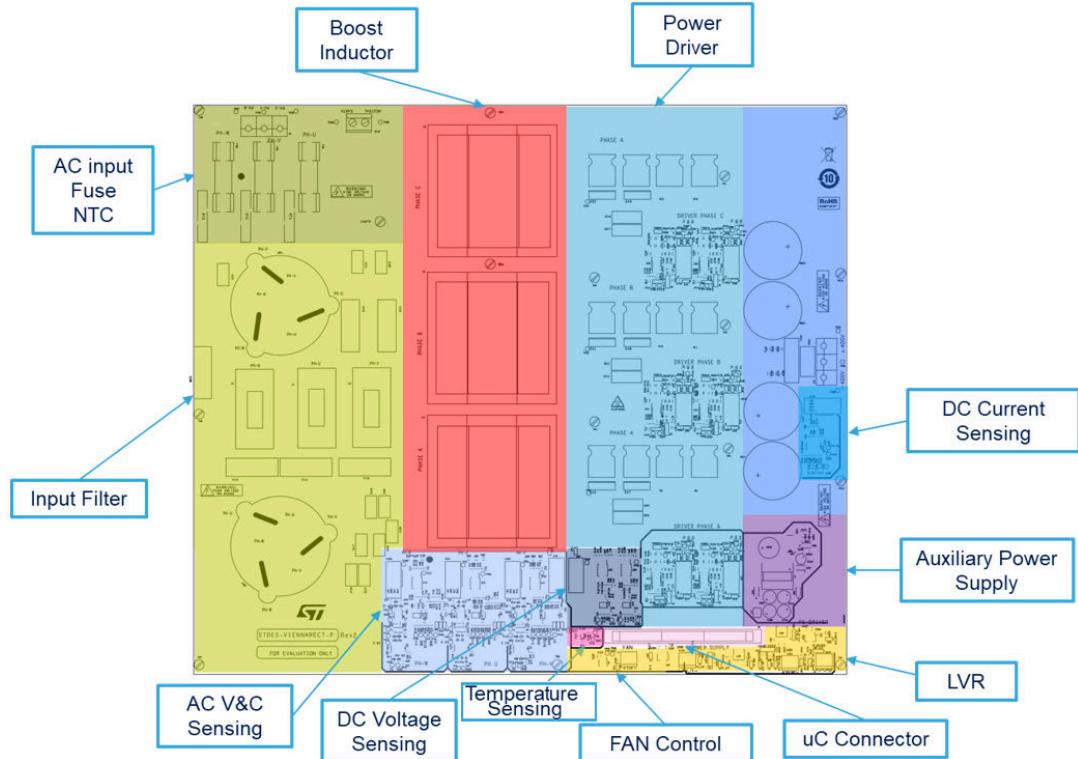

The figure below shows the power board of the [STDES-VRECTFD](#) reference design.

Figure 5. STDES-VRECTFD reference design - power board

The following figure shows the main sections of the power board.

Figure 6. STDES-VRECTFD power board sections

## 1.5.2 Power stage

### 1.5.2.1 Boost inductor

Boost inductors represent the energy storage elements that allow the PFC operation of the converter. This is obtained by controlling the inductor current and using a proper conduction pattern in the power device section.

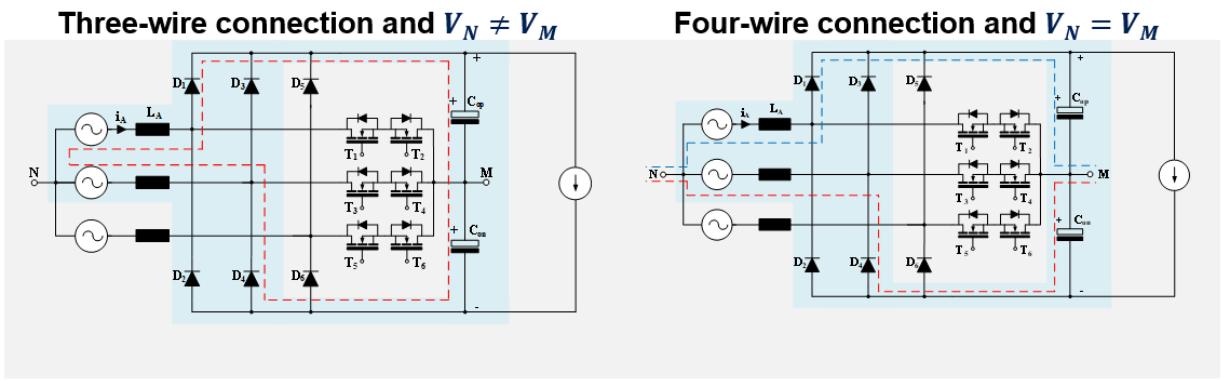

Continuous conduction mode (CCM) performs the PFC operation of this reference design. The inductance is related to several parameters: the desired current ripple, the available converter voltage levels, the switching frequency, and the rated DC-AC operation voltages.

**Table 3. Boost inductor parameters**

Parameter	Symbol	Value	Unit
DC voltage	$V_0$	800	V
Switching frequency	$f_{sw}$	70	kHz
Rated AC voltage	$V_{AC}$	230	V <sub>RMS</sub>
Max. ripple current	$\Delta i_{Lppmax}$	10	%
Boost inductance	$V_{AC}$	470.6	H

#### 1.5.2.2 Passive current limiter NTC

**Figure 7. Three and four-wire connections**

$$V_{DC} = \sqrt{2}V_{AC_{rms}}\sqrt{3}$$

$$V_{DC} = \sqrt{2}V_{AC_{rms}} * 2$$

**Figure 8. Focus on the STDES-VRECTFD NTC**

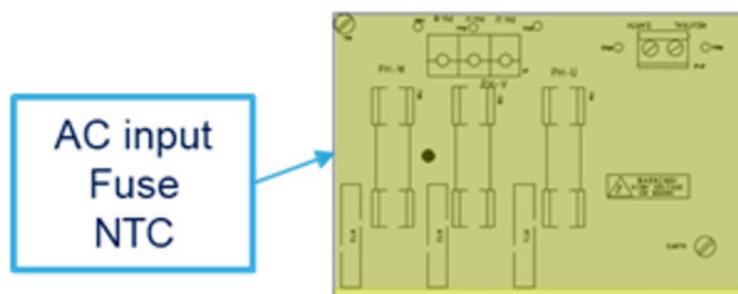

Figure 9. STDES-VRECTFD NTC specifications

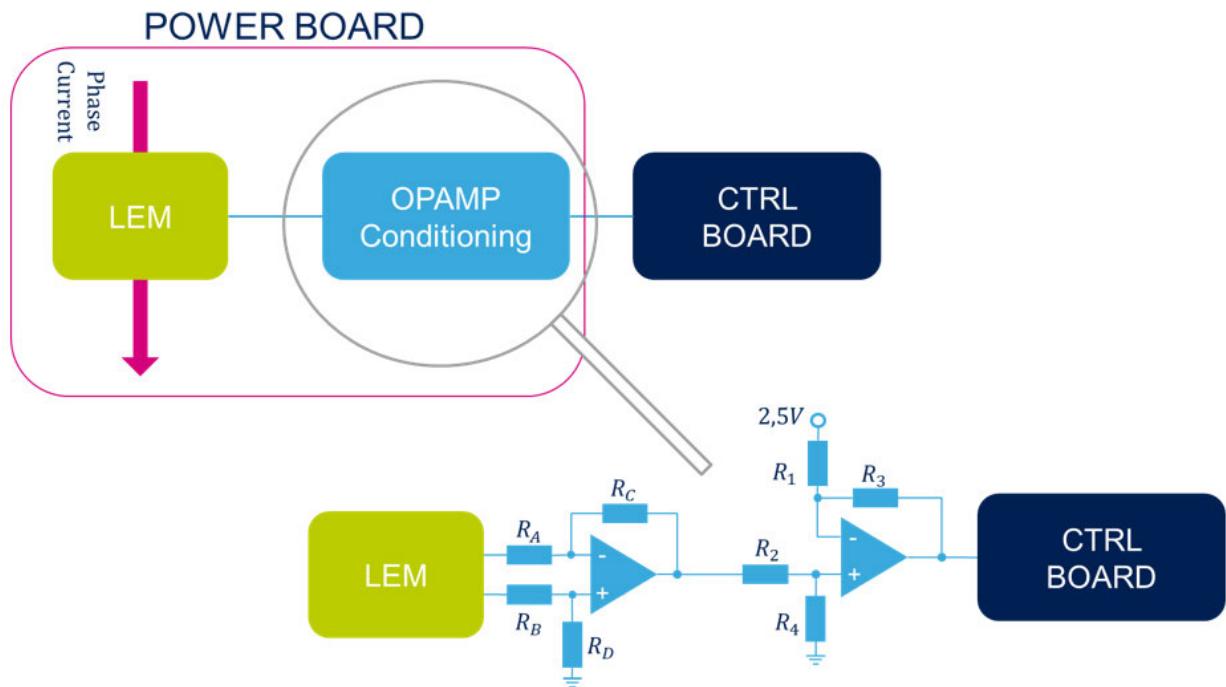

Min Resistance [Ω]	$R_{NTC_{min}} = \frac{\hat{V}_{AC}}{I_{max}}$	<i>e.g.</i> $R_{NTC} = \frac{\sqrt{2} \cdot 230}{60} = 5.42 [\Omega]$
Steady State Current [A]	$I_{NTC_{SS}} = \frac{P_{OUT}}{V_{AC_{rms}}} \cdot \eta$	<i>e.g.</i> $I_{NTC_{SS}} = \frac{4k}{230} \cdot 98\% = 17 [A]$
Maximum Energy [J]	$E_{NTC} = \frac{C \hat{V}_{AC}^2}{2}$	<i>e.g.</i> $E_{NTC} = \frac{313\mu F (\sqrt{2} \cdot 230)^2}{2} = 16 [A]$

### 1.5.2.3 Sensing

#### 1.5.2.3.1 AC current

An isolated sensor measures the AC input current. It represents the boost inductor current to be controlled for the proper operation of the power converter. Hall sensors are taken into consideration. A conditioning circuit allows obtaining the correct value for the ADCs. The circuit shown below is replicated for each phase.

Figure 10. AC current sensing block diagram

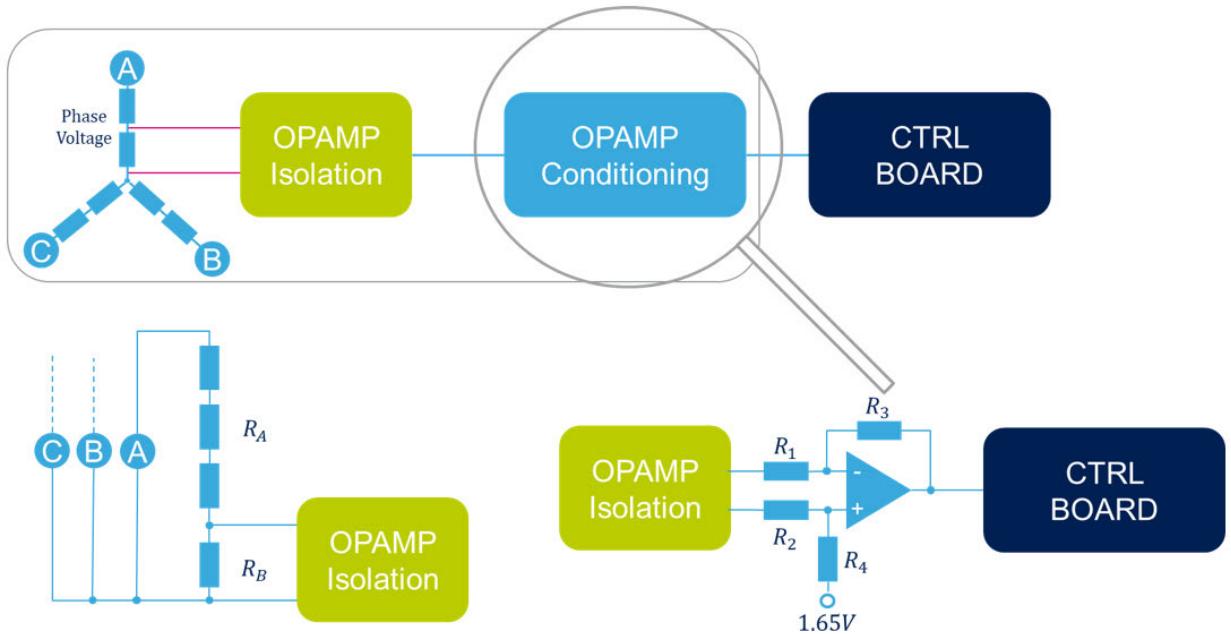

#### 1.5.2.3.2 AC voltage

The three-phase AC voltages are obtained using a two-stage sensor circuit. The first part represents an isolated op-amp that allows measuring the HV through a voltage divider with an isolation barrier.

This circuit allows measuring an AC voltage referenced by a virtual or grid neutral point. The circuit is replicated for each phase.

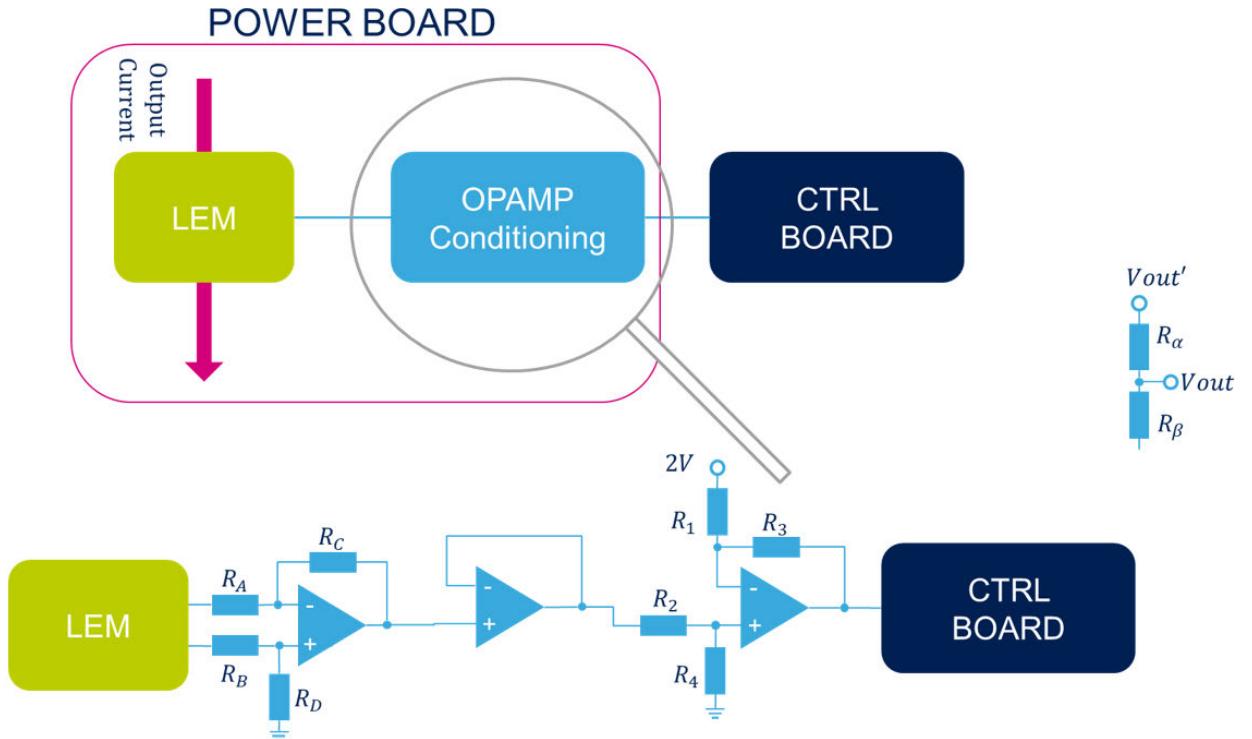

Figure 11. AC voltage sensing block diagram

#### 1.5.2.3.3 DC current

An isolated sensor measures the DC output current. Hall sensors are taken into consideration. A conditioning circuit allows obtaining the correct value for the ADCs.

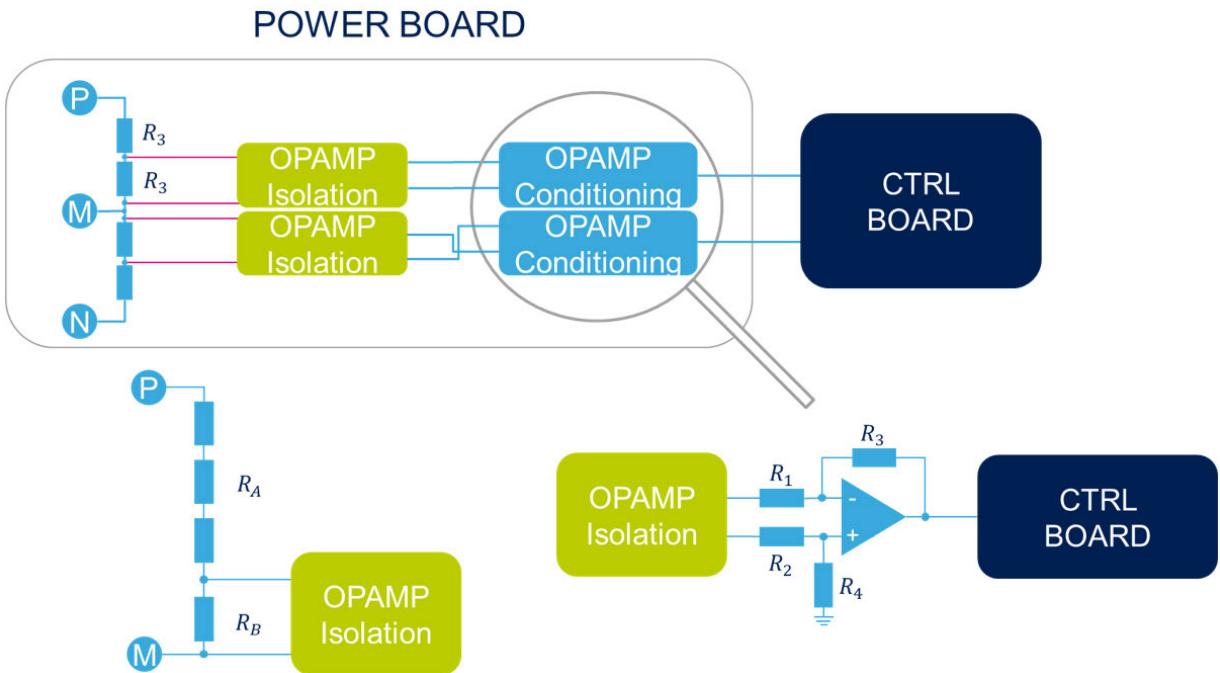

Figure 12. DC current sensing block diagram

#### 1.5.2.3.4 DC voltage

The DC voltages are obtained using two-stage sensing. The total DC bus voltage is split exploiting two voltage dividers. Both voltages are needed to obtain the monitoring of each capacitor to avoid overvoltage, offering independent DC voltages for the control.

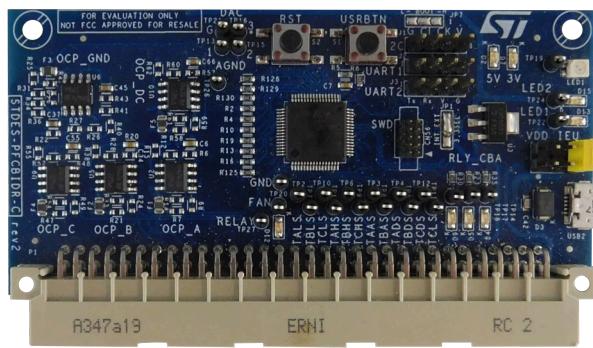

Figure 13. DC voltage sensing block diagram

### 1.5.3 Control board

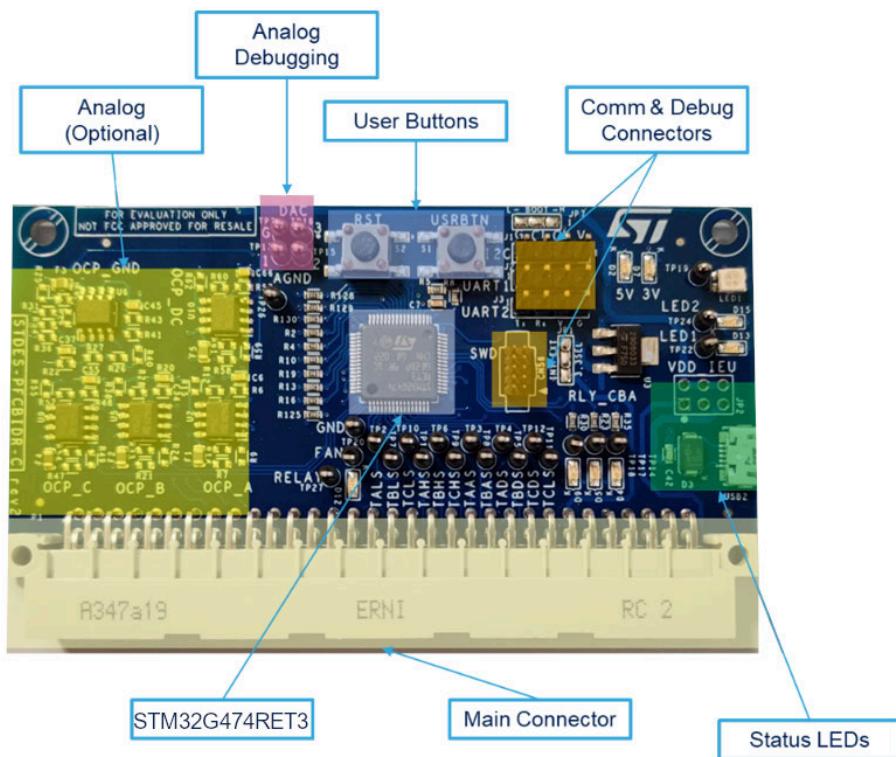

The figure below shows the control board of the STDES-VRECTFD reference design.

Figure 14. STDES-VRECTFD reference design - control board

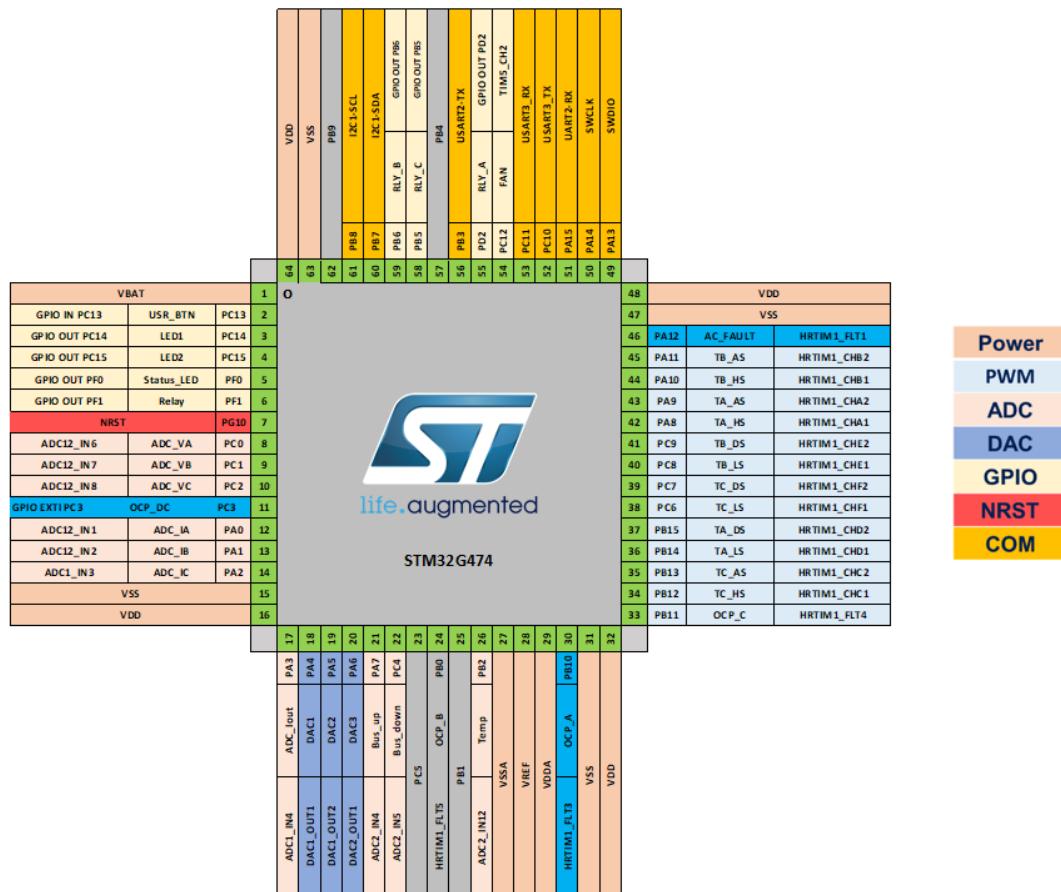

The following figure shows the main sections of the control board.

**Figure 15.** STDES-VRECTFD control board sections

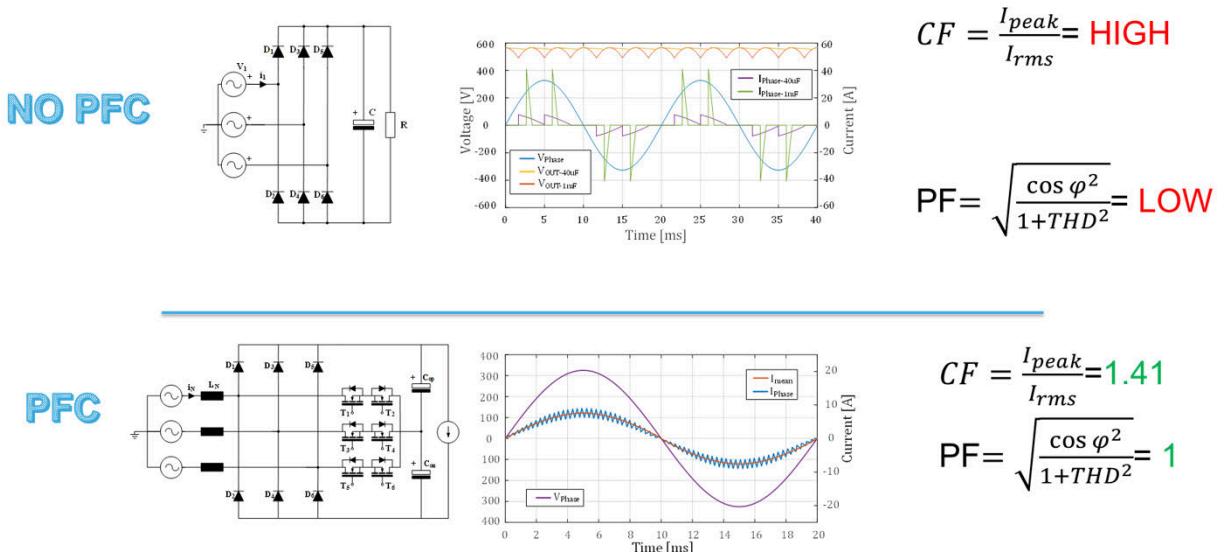

**Figure 16. STDES-VRECTFD MCU pin assignment**

## 1.6 Power factor correction (PFC) benefits

The figure below highlights the PFC benefits in terms of rest factor and power factor.

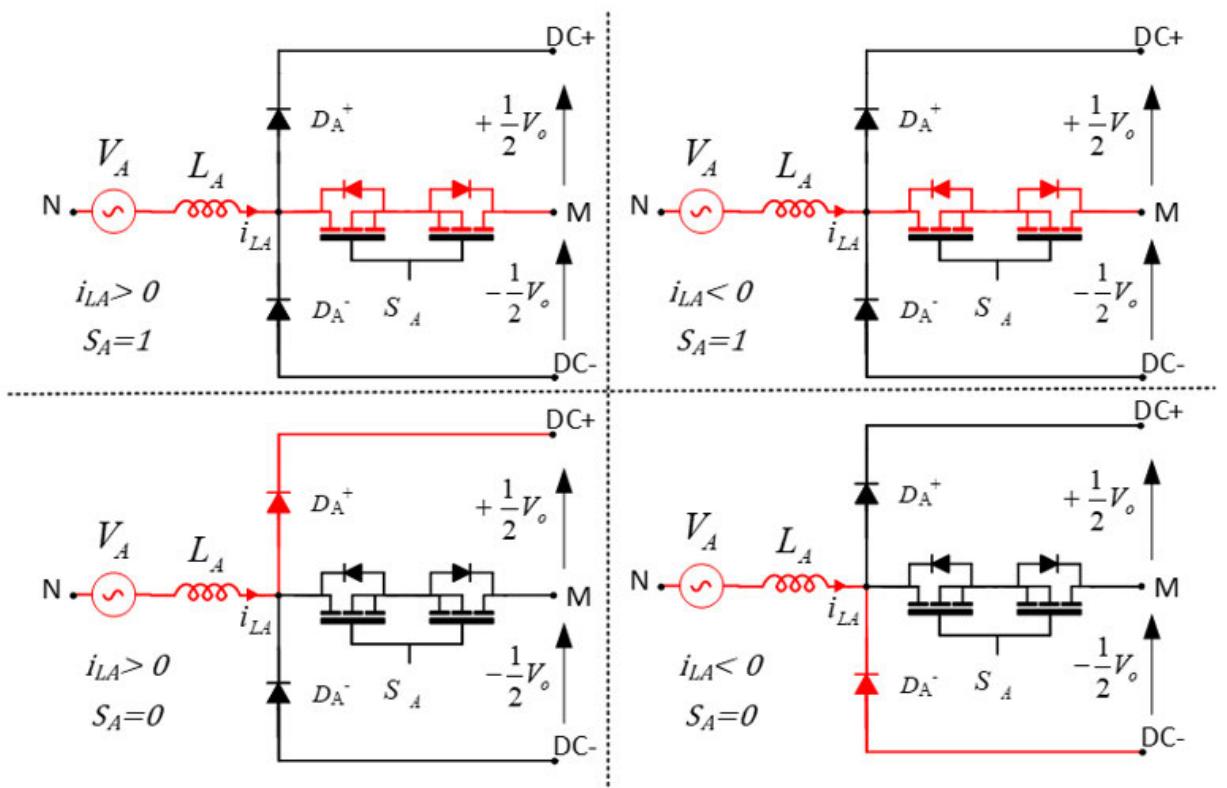

**Figure 17. PFC benefits**

## 1.7 Converter operation

The figure below shows the current paths of the Vienna topology. To simplify the scheme, we considered the single phase representation.

**Figure 18. Switching paths of the Vienna topology**

## 2 How to use the STDES-VRECTFD reference design

### 2.1 System setup

To use the [STDES-VRECTFD](#), you need:

- a programmable AC emulator or a programmable AC source;
- a DC electronic load;
- a power analyzer;
- a digital oscilloscope.

You can test the [STDES-VRECTFD](#) up to 15 kW at 230 V<sub>AC</sub> RMS and 6 kW at 110 V<sub>AC</sub> RMS in a frequency between 47 and 63 Hz.

### 2.2 How to connect the reference design

To operate the reference design power converter properly, consider the operating limits shown below.

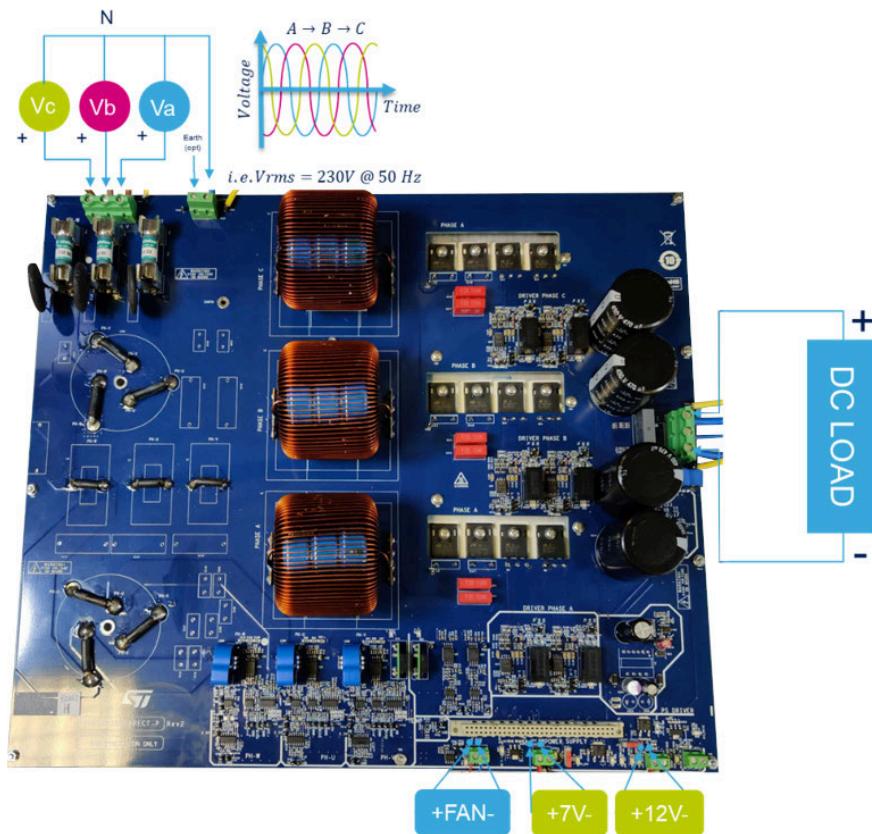

**Table 4. Operation condition limits**

Description	Value	Unit
Three-phase input voltage range	208-400	V <sub>AC</sub>
Line frequency range	47-63	Hz
Maximum output power at 230 V <sub>AC</sub>	15	kW
Voltage limit of the bulk capacitors	500	V

**Step 1.** Connect the power board as shown in the figure below.

The figure below shows the three-phase connection sequence (A-B-C). The neutral connection is optional. The polarity influences the DC load connection.

**Figure 19. STDES-VRECTFD connection**

**Step 2.** Connect an external fan to manage the thermal dissipation.

The auxiliary power supply can be externally provided.

## 2.3

### MCU programming and debugging

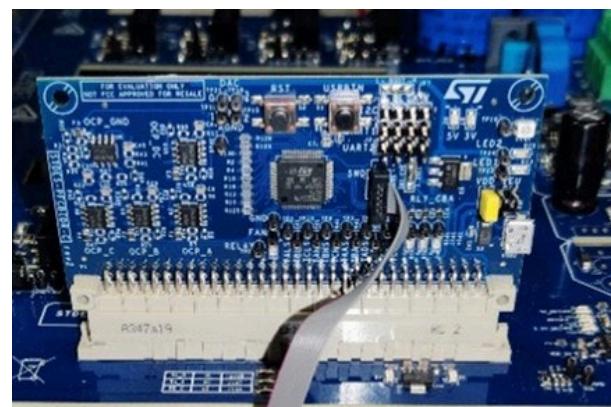

You can program and debug the microcontroller unit (MCU) through different tools.

**Step 1.** Use ST-LINK/V2 and a 20- to 10-pin JTAG adapter to connect the platform to the PC.

**Figure 20. ST-LINK/V2 and adapter**

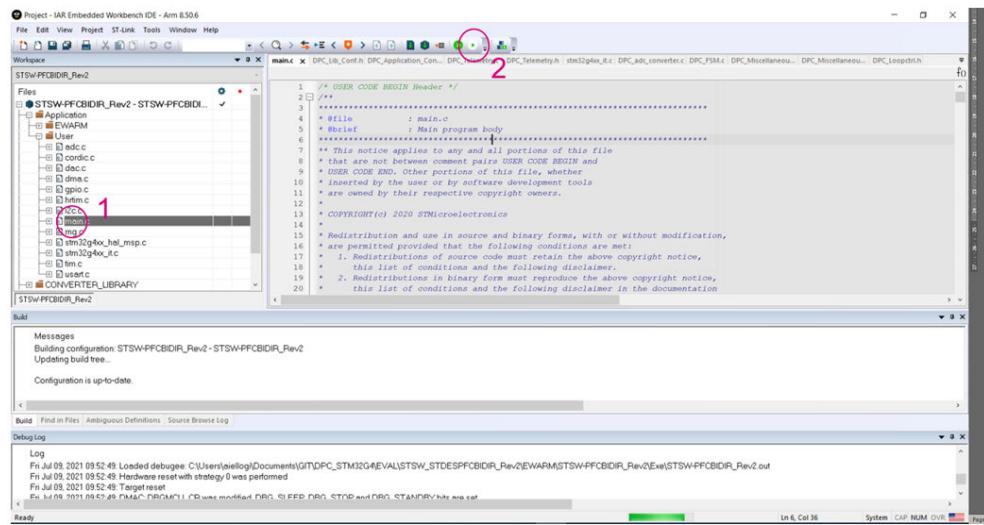

**Figure 21. ST-LINK/V2 connected to the control board**

**Step 2.** Select the main.c file in the project/Application/User path.

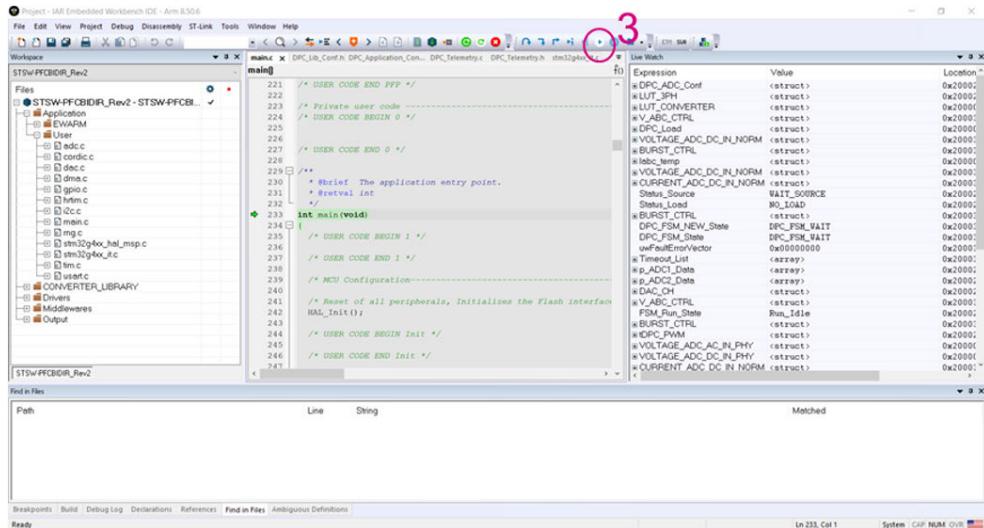

**Step 3.** Click on the [Download and debug] button to start programming and debugging.

**Figure 22. IAR EWARM program procedure**

**Step 4.** Click on the [Run] button to start the code execution.

**Figure 23. IAR EWARM debug procedure**

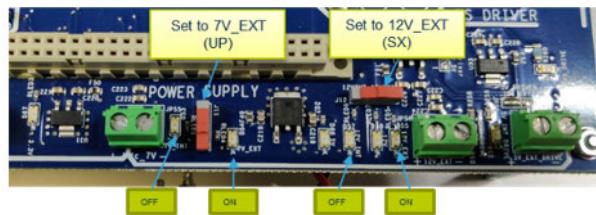

### 2.3.1 Power supply section

The power supply needs two different input voltages. An embedded SMPS, based on the VIPER26 family, provides self-powering from the DC-link.

As shown in the figure below, you can select either an internal or external supply voltage. Specific LEDs allow identifying the selected configuration.

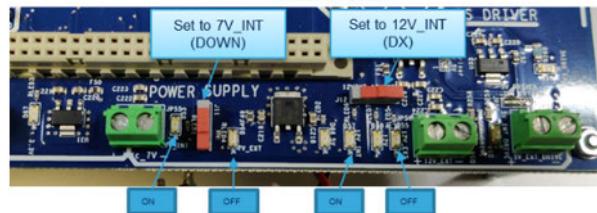

**Figure 24. Example of power supply configuration**

## Power Supply Selector (external)

## Power Supply Selector (internal)

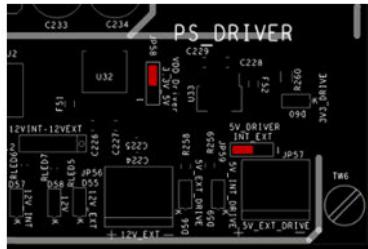

Reserved

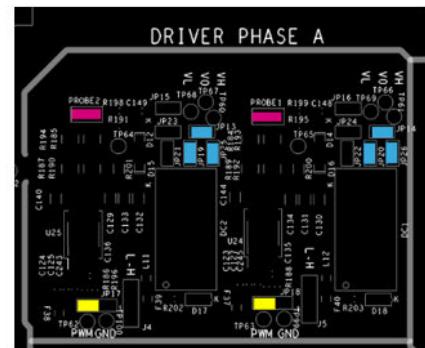

### 2.3.2 Driver section

The driving section configuration is related to the power switch technology. In this case, we considered the SiC power MOSFETs. The figure below shows this specific configuration.

**Figure 25. Example of driver configuration**

## Driver section power supply selector

## Gate driver VH VL selector

2.4

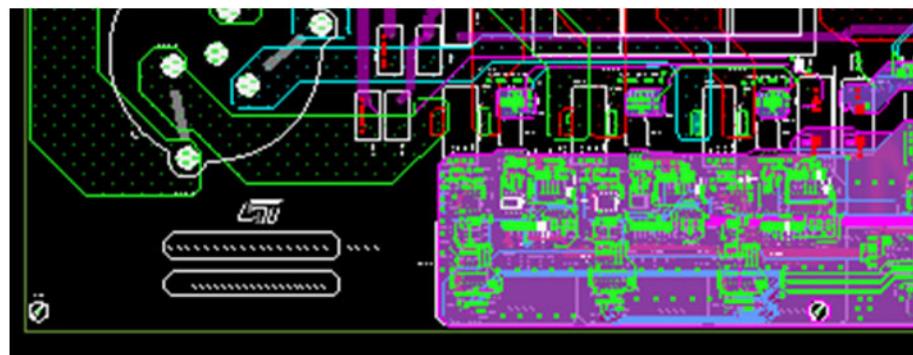

## Preliminary test procedure

## 2.4.1

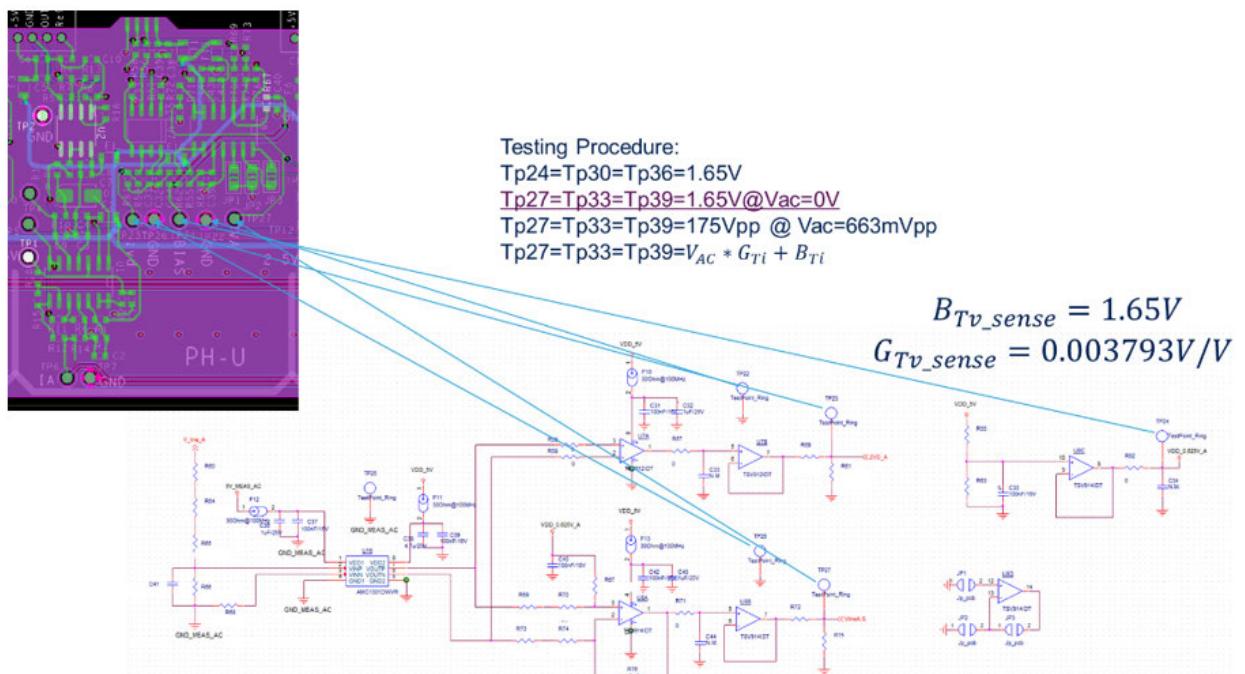

## AC sensing

To verify the proper operation of the AC sensing (Figure 26), analyze the test points for voltages (Figure 27) and currents (Figure 28).

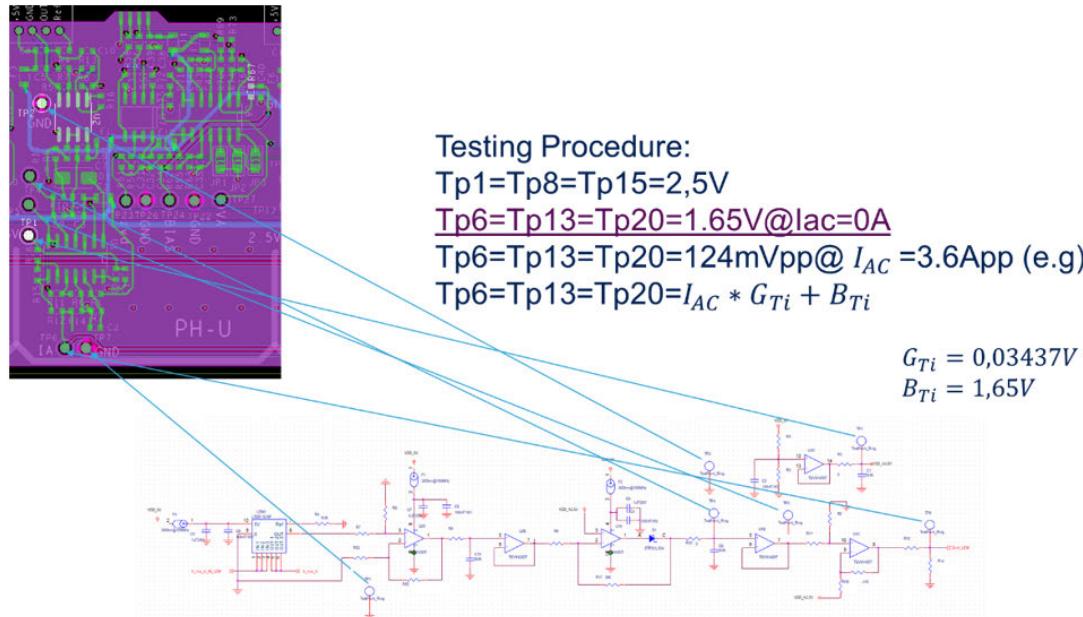

**Figure 26.** AC sensing section

**Figure 27.** AC voltage sensing test procedure

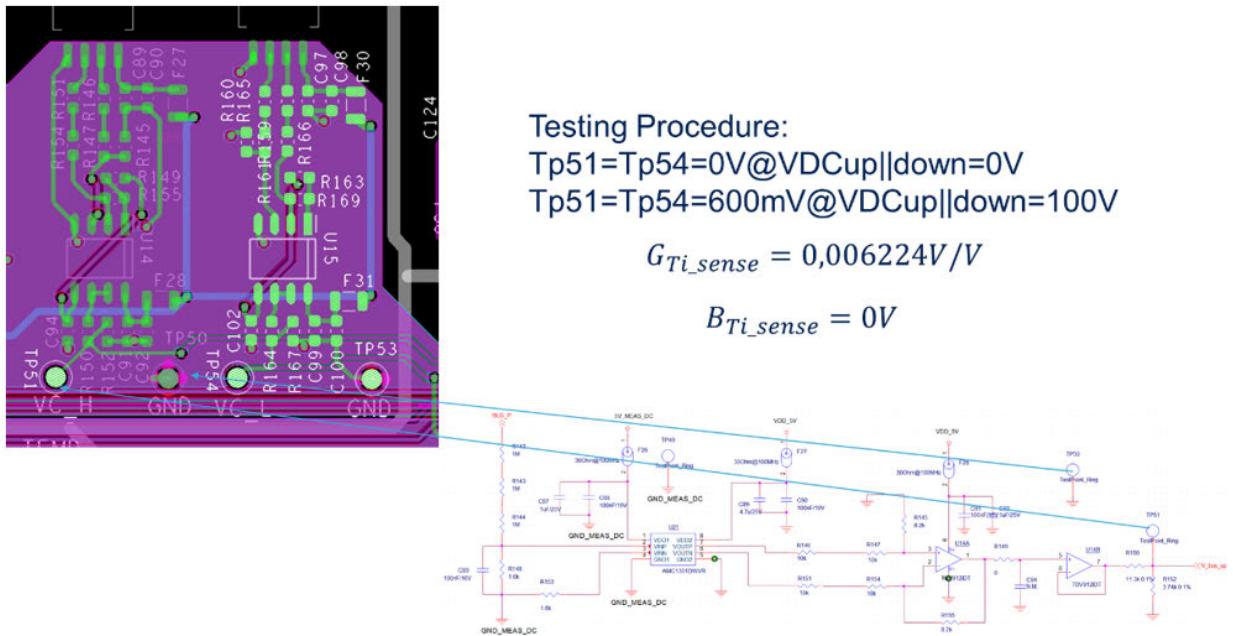

**Figure 28. AC grid current sensing test procedure**

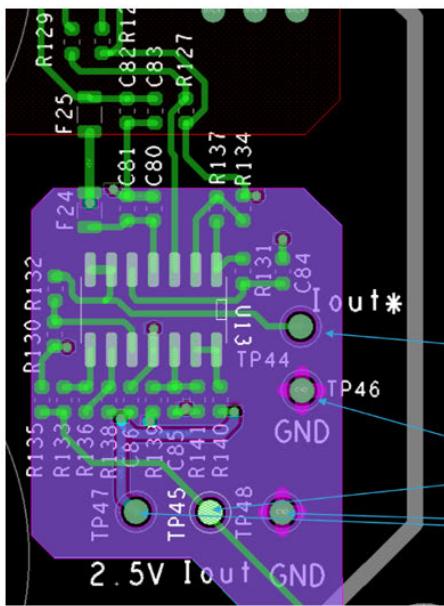

## 2.4.2 DC sensing

To verify the proper operation of the DC sensing, analyze the test points for voltages (Figure 29) and currents (Figure 30).

**Figure 29. DC voltage sensing test procedure**

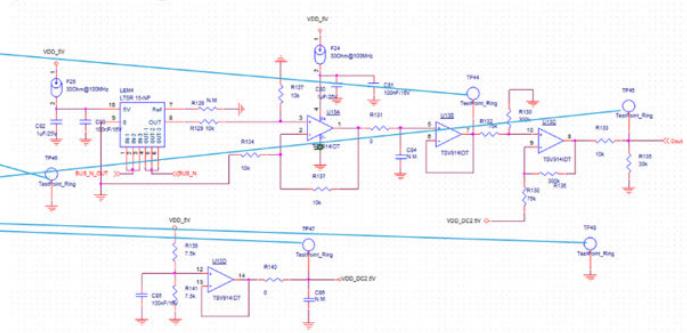

**Figure 30. DC current sensing test procedure**

Testing Procedure:  
 $Tp44=2,5V@Idc=0A$   
 $Tp47=2,5V$   
 $Tp45=0V@Idc=0A$   
 $Tp44=2,58V@Idc=2,08A$   
 $Tp45=258mV@Idc=2,11A$

$$G_{Ti\_sense} = 0,11A/V$$

$$B_{Ti\_sense} = 0V$$

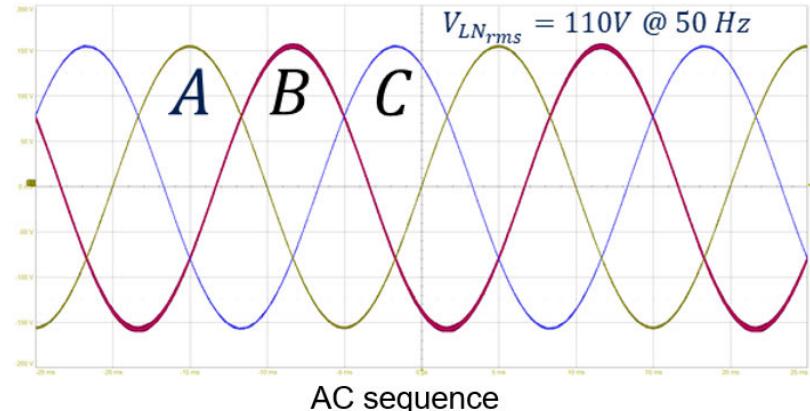

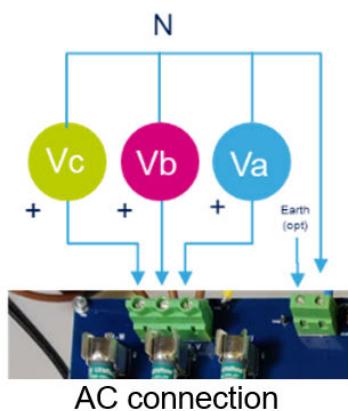

#### 2.4.3 AC connection

Check that the STDES-VRECTFD AC main connection is in line with the figure below.

A three-phase sequence (ABC) is mandatory for the proper operation of the power converter.

**Figure 31. AC connection and sequence**

#### 2.4.4 DC connection

The figure below shows the output DC connection. Ensure to apply the correct polarity.

Figure 32. DC side load connection

## 2.5 Startup procedure

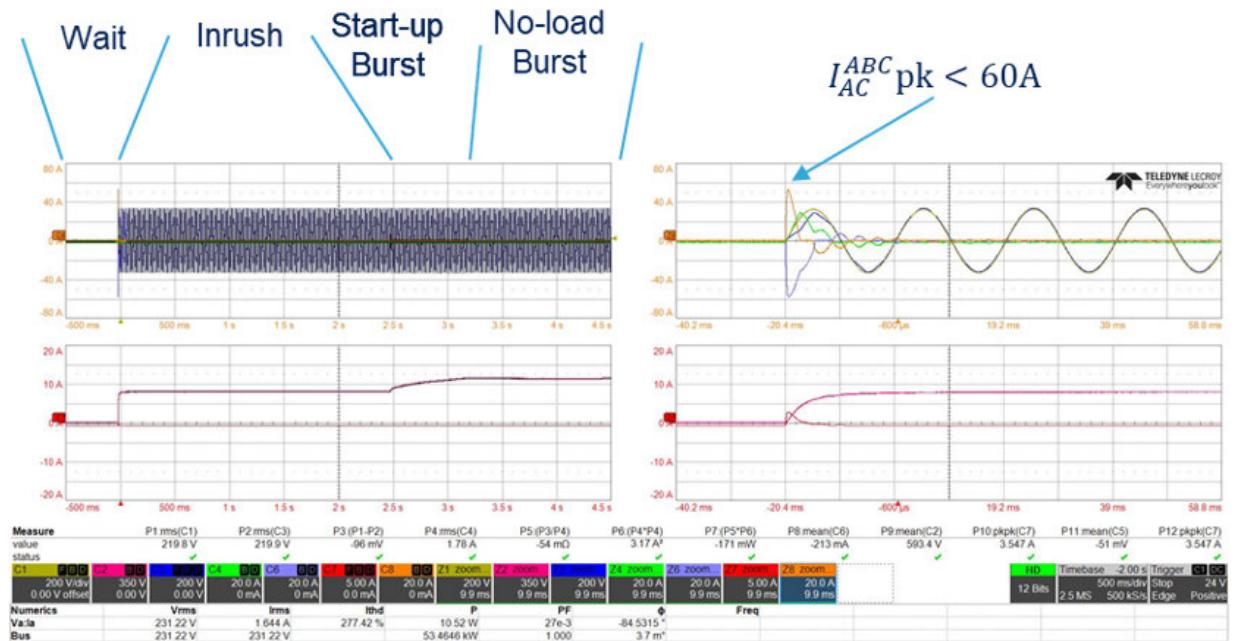

After connection and debugging initialization, you can perform the startup procedure.

An embedded finite state machine handles this procedure. It consists of different states that perform a preliminary check of the converter and the precharge of the capacitor. Then the burst operation boosts the output voltage.

The STDES-VRECTFD reference design allows managing the complete startup procedure.

However, a controlled step-by-step procedure is available. It is useful during the preliminary test or after hardware/sw modification.

Figure 33. Startup procedure

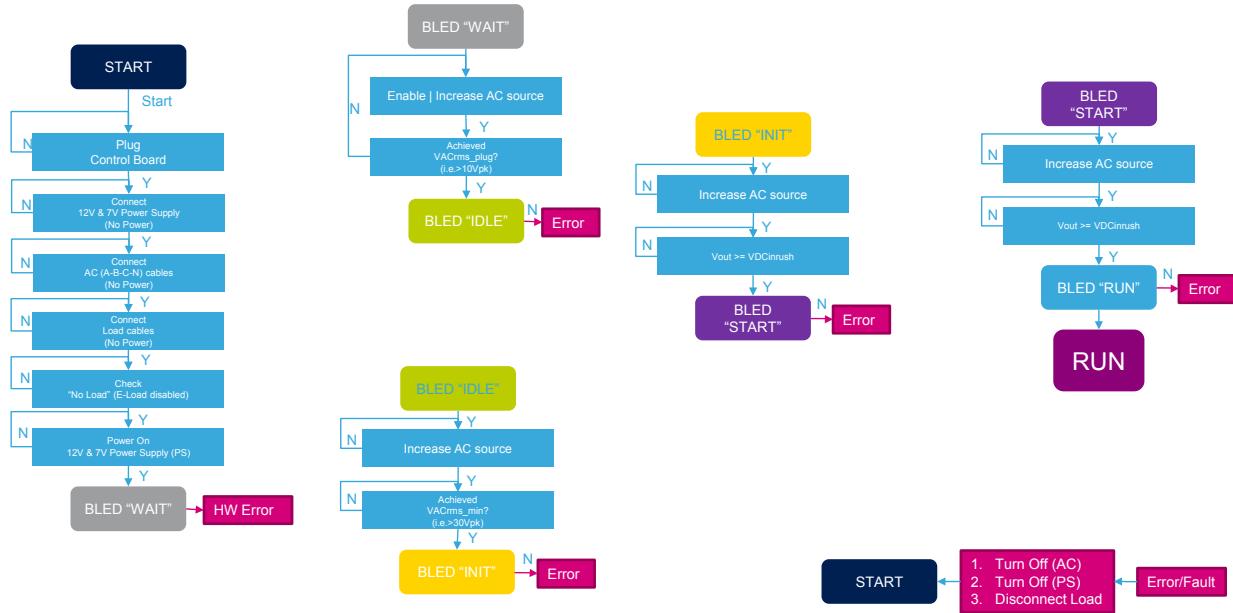

AC OFF → AC ON

$V_{AC\_{LN}} = 0 \rightarrow 230\text{Vrms}$

### 2.5.1 Controlled startup procedure

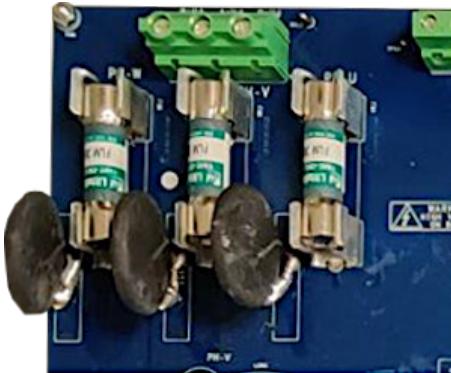

The AC power supply is slowly increased to verify the procedure step step-by-step as shown below.

### Figure 34. Connection and power-on procedure

This procedure takes the ICL NTCs into consideration.

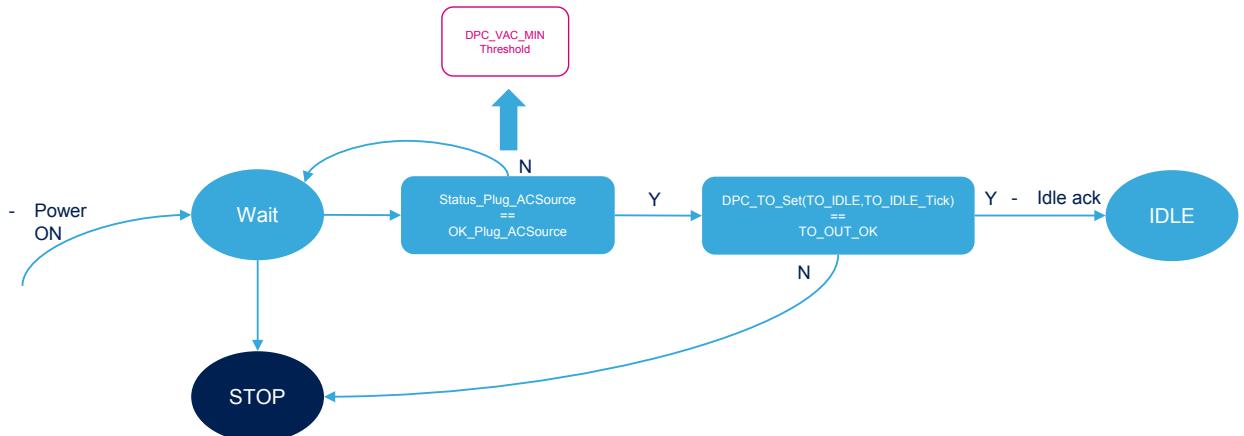

**Figure 35. STDES- VRECTFD ICL NTCs**

The procedure consists of the following steps.

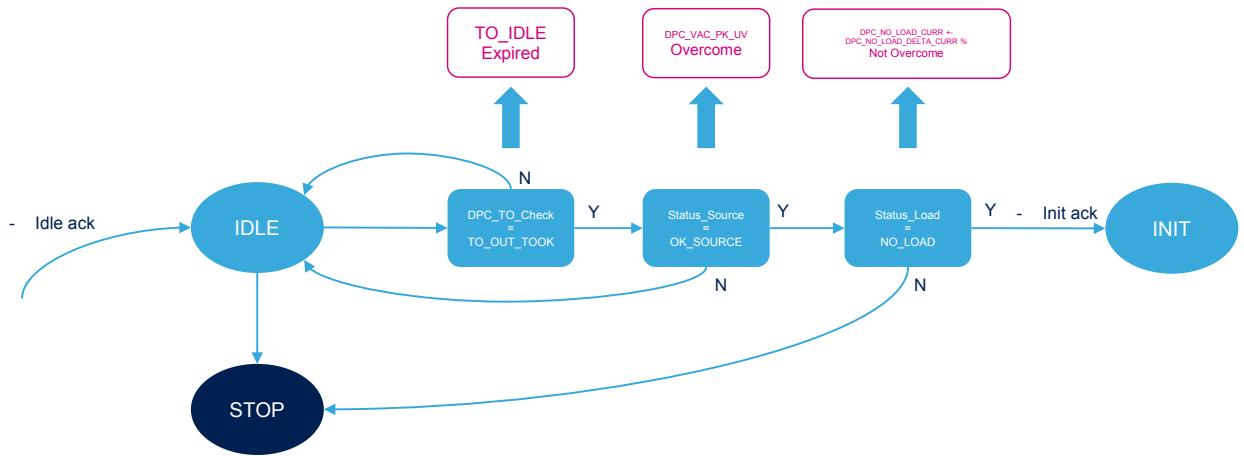

1. **FSM Wait:** PWM signals are in IDLE state, configured in low state, to force all the MOSFETs in off state. The AC main voltage is already under monitoring. This state is maintained until AC main reaches a lower AC voltage threshold (`OK_Plug_ACSource`), that is 30 V<sub>AC</sub>. After that, an internal timeout (`TO_IDLE`) is activated to prevent power converter connection during the first-phase synchronization procedure. FSM moves on to **FSM\_Idle**.

**Figure 36. FSM\_Wait block diagram**

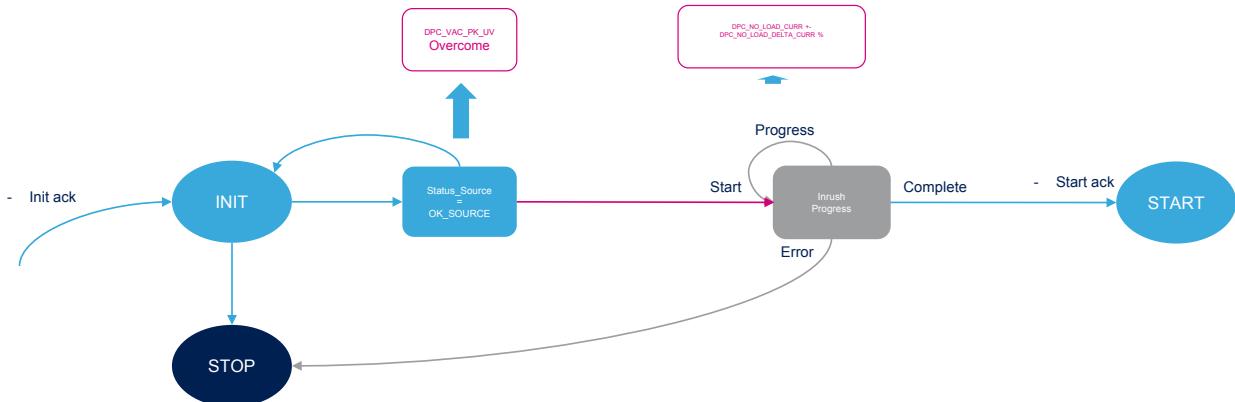

2. **FSM Idle:** after `TO_IDLE` time elapses, wait for the AC mains to reach the uvAC value (`OK_SOURCE`). After checking the load current, a new timeout is set (`TO_INIT`) to prevent PLL instability. FSM moves to **FSM\_Init**.

**Figure 37. FSM\_Idle block diagram**

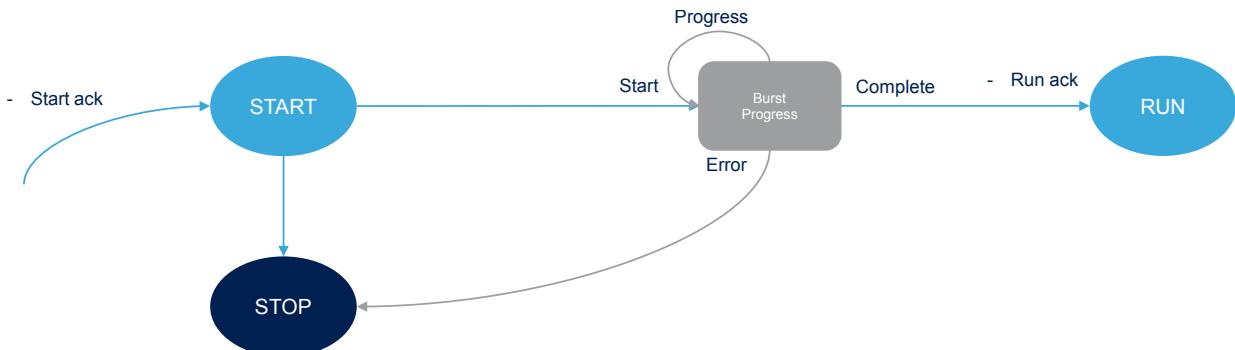

3. **FSM\_Init:** handles the inrush current control. If the grid voltage is correct, the status source is equal to `OK_SOURCE`. The bulk capacitors are at low voltage and the inrush current must be limited. For this reason, during this state, the inrush relays are considered in series with a high resistance. On the basis of their values, the inrush is completed. The state machine state is still maintained to stabilize the output voltage according to the grid amplitude. After a configurable time, the FSM moves to start state (`FSM_Start`).

**Figure 38. FSM\_Init block diagram**

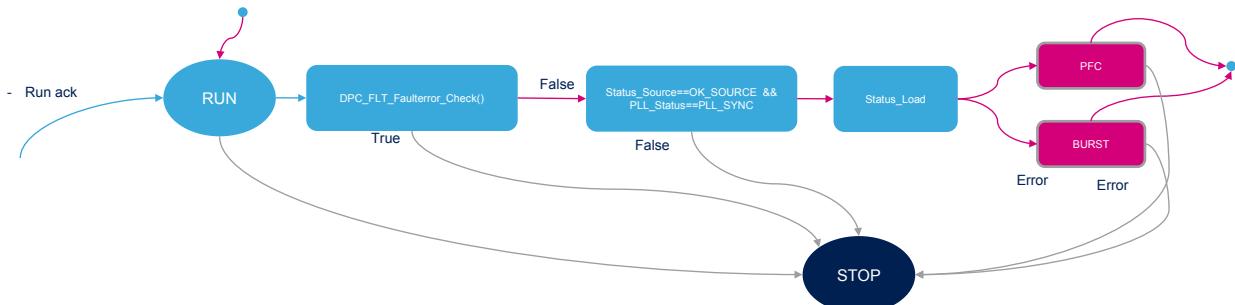

4. **FSM\_Start:** is related to the burst mode operation of the power converter. During this procedure, the PWM is activated. The pulse sequence at a fixed duty cycle allows boosting the input voltage and increasing the DC output voltage at a reference voltage. The state machine then moves to `FSM_Run` state.

**Figure 39. FSM\_Start block diagram**

5. **FSM\_Run:** if the startup procedure is completed without any issue, `FSM_Start` manages the PFC operation of the power converter. The burst operation still maintains the DC voltage. If a DC load occurs, the PFC modulation and the control loop are activated to handle the load power demand.

**Figure 40. FSM\_Run block diagram**

## 2.5.2 Direct startup procedure

The finite state machine manages a direct startup procedure. The AC source takes the nominal voltage into consideration. The inrush current limitation and the burst mode operation must be completed after the DC load connection.

### 3 Control

The voltage-oriented control allows controlling the PFC behavior of the converter in the dq-axis synchronous reference frame.

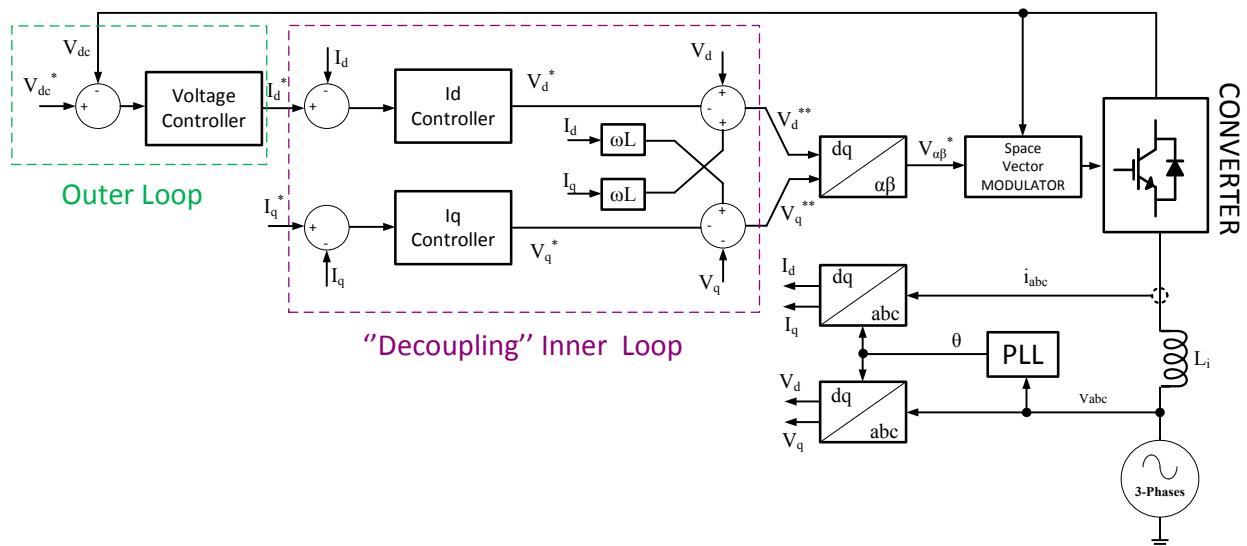

**Table 5. Control strategy comparison**

Reference frame	Pros	Cons
3-axis stationary reference frame (abc)	<ul style="list-style-type: none"> <li>Simple implementation with PI</li> <li>Avoids effort in the reference transformation</li> <li>Best results with the PR regulator (no analog)</li> <li>Best choice for the analog version</li> </ul>	<ul style="list-style-type: none"> <li>Poor in transient</li> <li>Phase shifting (lag)</li> <li>Needs three regulators (three-phase)</li> <li>Necessary high bandwidth (noise)</li> <li>Steady state error</li> </ul>
2-axis stationary reference frame ( $\alpha\beta$ )	<ul style="list-style-type: none"> <li>Use two regulators instead of three</li> <li>Simple implementation with PI</li> <li>Best results with the PR regulator (no analog)</li> </ul>	<ul style="list-style-type: none"> <li>Poor in transient</li> <li>Phase shifting (lag)</li> <li>Digital version only</li> <li>Necessary high bandwidth (noise)</li> </ul>
2-axis synchronous reference frame (dq)	<ul style="list-style-type: none"> <li>Zero steady state error (DC reference)</li> <li>Use of a simple PI (simple structure of the regulator)</li> <li>Low bandwidth is allowed (robust)</li> <li>Best in transient (first order behavior)</li> </ul>	<ul style="list-style-type: none"> <li>Effort frame transformation</li> <li>Digital version only</li> <li>Necessary high bandwidth (noise)</li> <li>Implementation</li> </ul>

#### 3.1 Control strategy

This reference design power converter can be represented as a second order dynamic system, which consists of inductors and capacitors. The theoretical different dynamic behavior of this two-system element allows considering two fully decoupling first order systems. For this reason, a current control and a voltage control are taken into account.

**Figure 41. Cascaded control**

##### 3.1.1 Current control strategy

A continuous conduction mode controls the reference design current.

Figure 42. Continuous conduction mode in current control

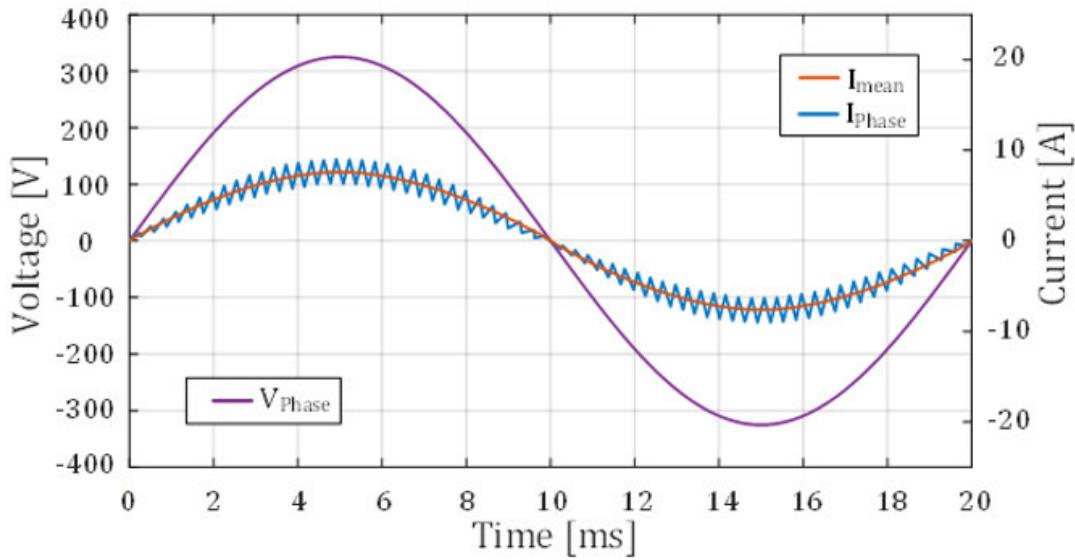

Figure 43. Current decoupling control of the reference design converter model

## CURRENT CONTROL MODEL

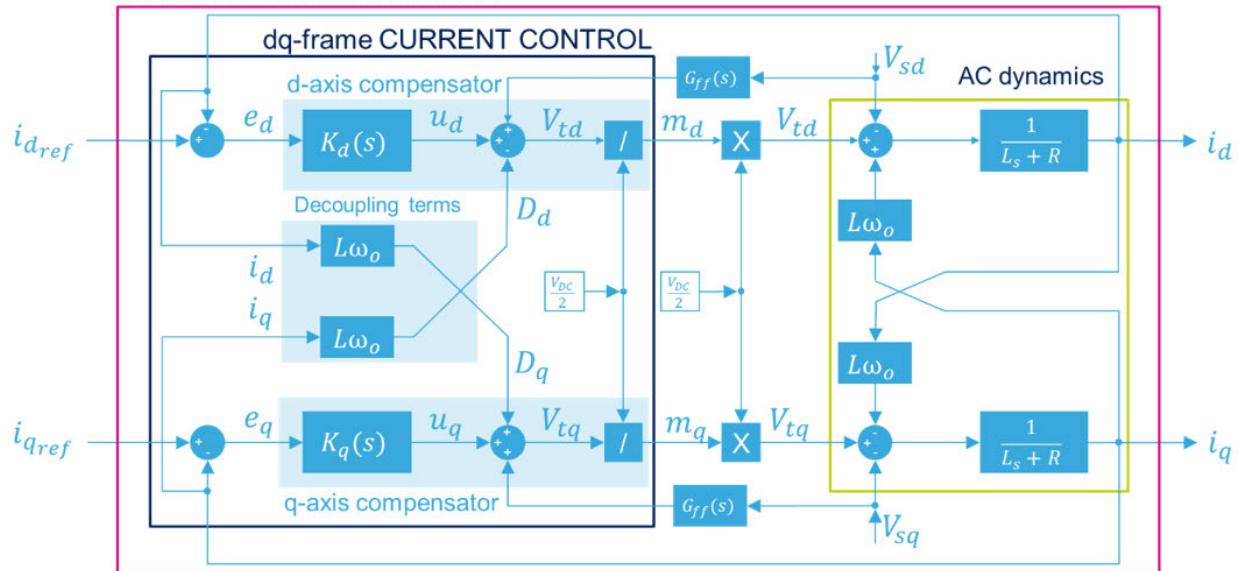

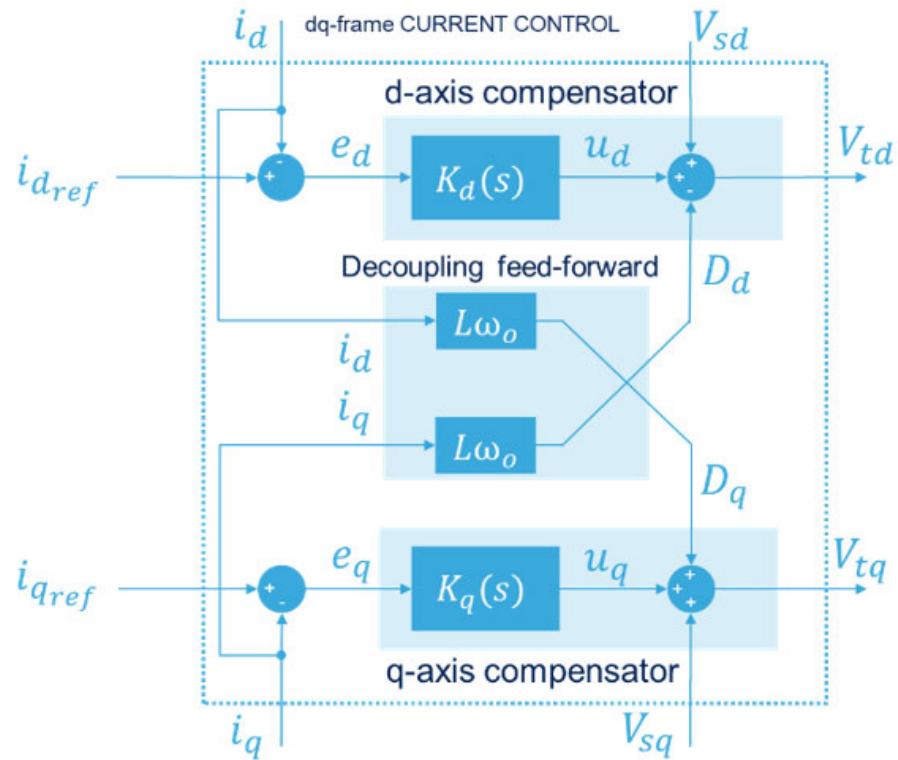

Figure 44. CDC

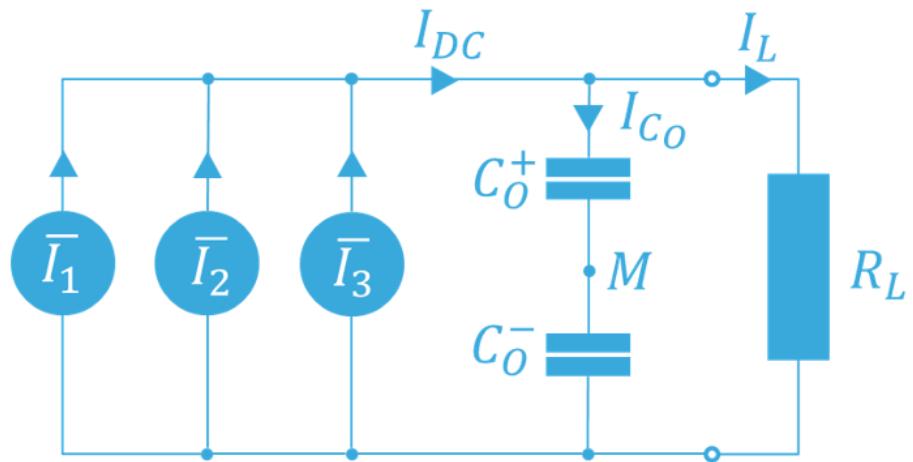

## 3.1.2

**Voltage control strategy**

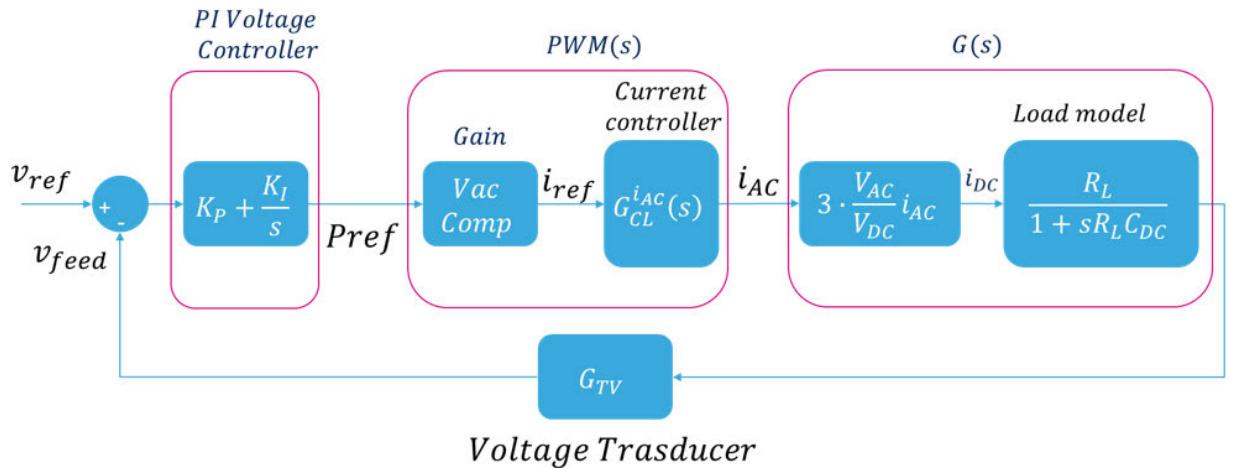

The outer loop of the PFC operation is a voltage control.

Figure 45. Converter DC side model

The figure below shows the closed loop representation of the above model.

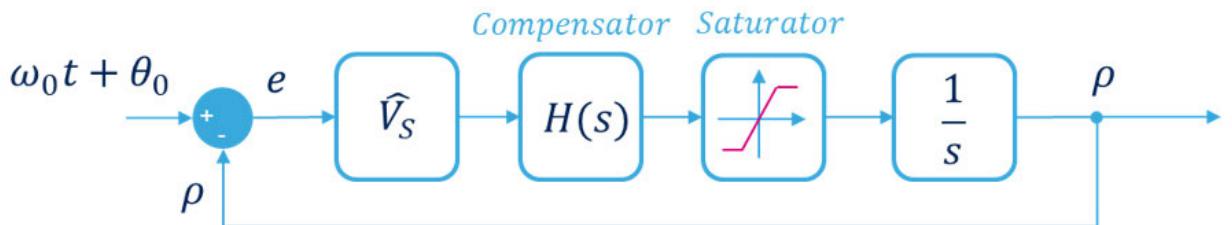

**Figure 46. Voltage control diagram**

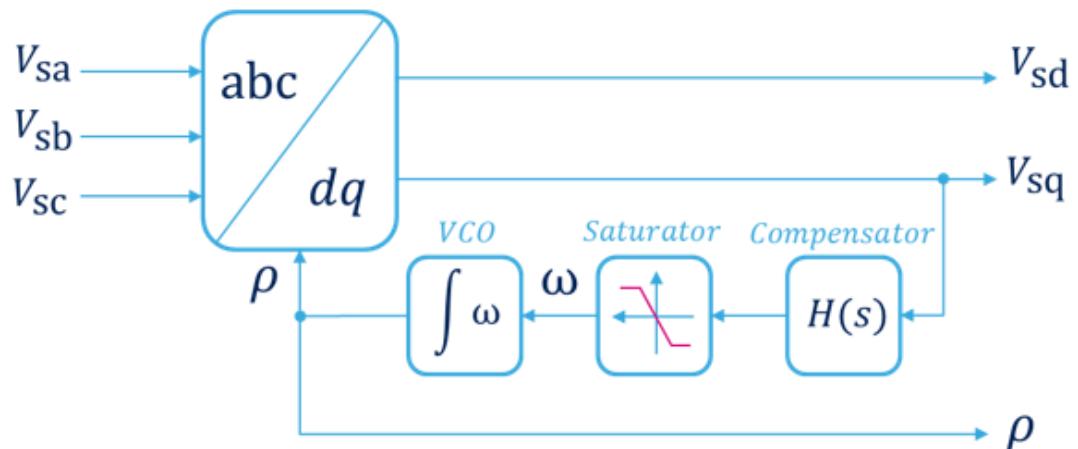

### 3.2 Phase locked loop

In converter control, the PI regulators are usually used. This kind of regulator gets the best results when using a DC reference term.

**Figure 47. PLL internal regulator loop**

**Figure 48. PLL in AC main voltage**

## 4 Software implementation

The STM32G474RET3 MCU controls the STDES-VRECTFD.

The firmware package is based on the STM32Cube ecosystem. Starting from the STM32CubeMX, all the peripherals and pins used are activated and configured according to the basic project.

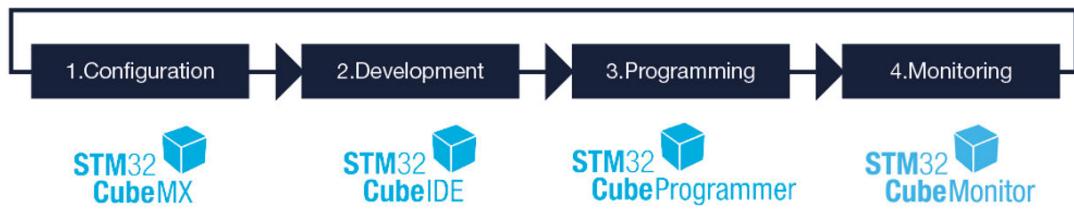

The application firmware is supported and tested using STM32CubeIDE, IAR, and Keil development environments.

After the development, the MCU can be programmed through the IDE or STM32CubeProgrammer.

To monitor and control the application, you can use a GUI based on STM32CubeMonitor.

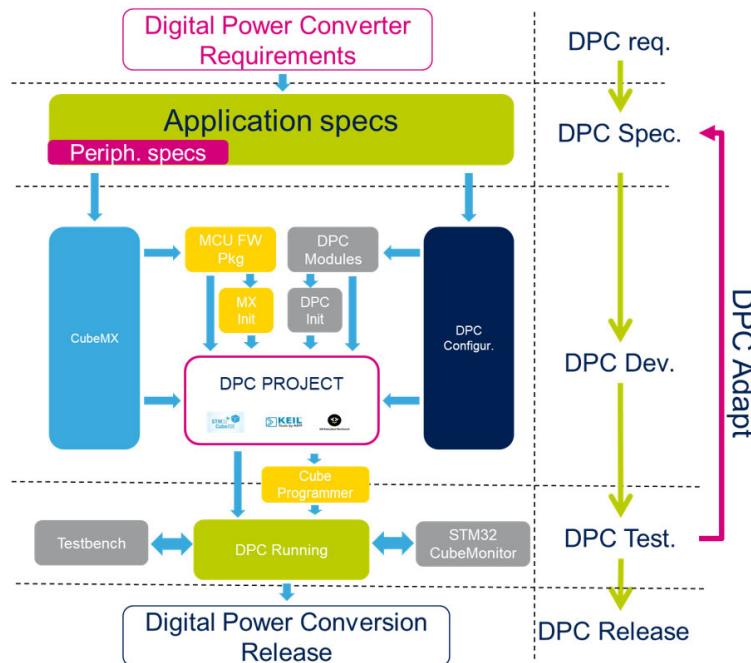

The firmware described in this documentation development is based on the STM32CubeG4 firmware package v1.3.0.

Figure 49. STM32Cube ecosystem development flow

An extensive range of generic and specific firmware modules is available to support the digital power conversion. The figure below shows the generic development flow to get the power conversion used for the STDES-VRECTFD firmware development.

Figure 50. DPC development flow

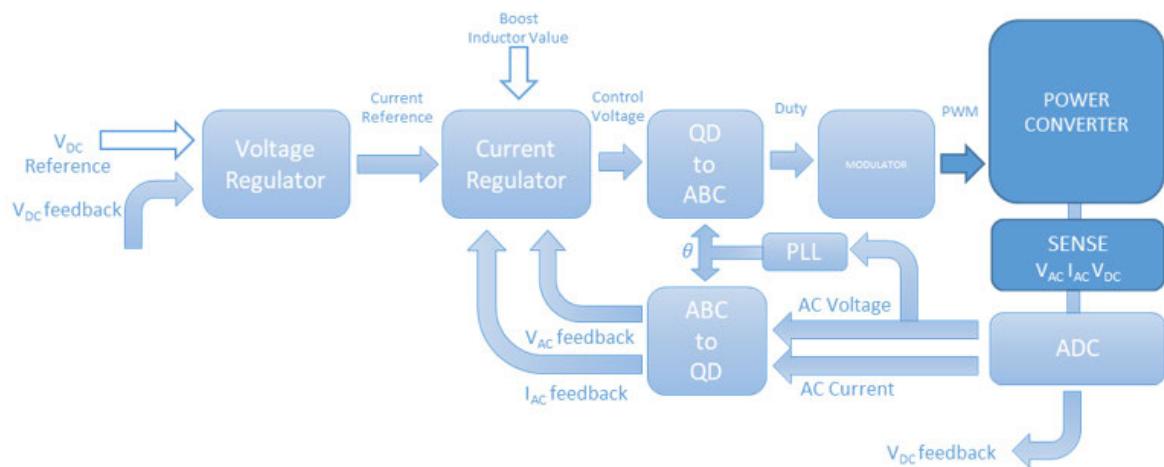

This workflow starts from power conversion requirements. This information is then reinterpreted in the application specs that contain information linked to the MCU peripheral and the DPC application configuration.

On the basis of this information, an STM32CubeMX project, properly configured and initialized, is provided. Then, the needed DPC module is included and configured.

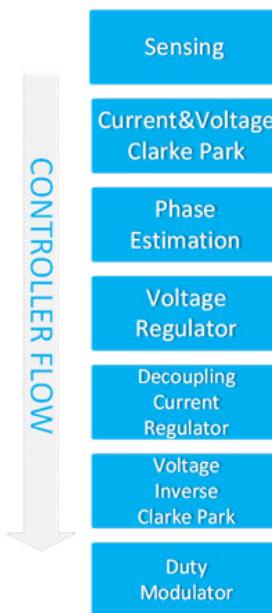

The STM32CubeMX generates the development IDE project. The MCU is directly flashed through the IDE or STM32CubeProgrammer. At the end of this operation, the DPC application is tested and debugged through STM32CubeMonitor. The digital power converter firmware is then released, if compliant, and the DPC is adapted. The STDES-VRECTFD reference design power converter allows managing the energy flow. The figure below shows the algorithm schematic diagram of the implementation in the AC-DC rectifier application.

**Figure 51. AC-DC rectifier application**

The figure below shows the basic representation of the execution flow. A current decoupling control well fitted for this application is used. This allows managing the energy flow in terms of AC current.

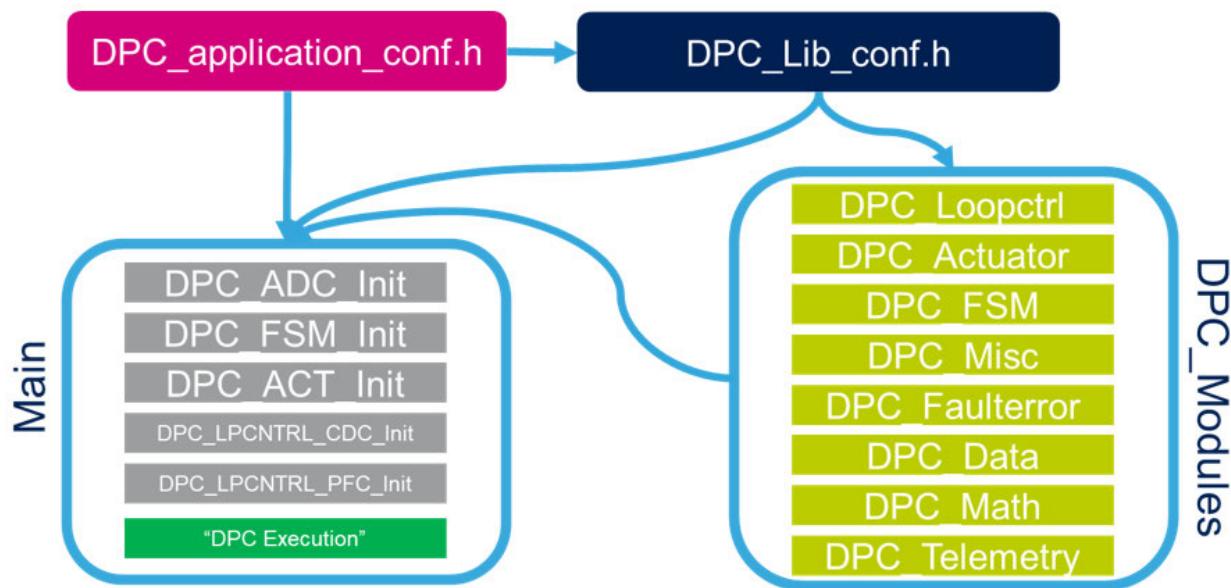

**Figure 52. Simplified execution task of the control in AC-DC**

#### 4.1 Configuration files

The STDES-VRECTFD power converter configuration is based on two main configuration files.

Figure 53. STDES-VRECTFD configuration files

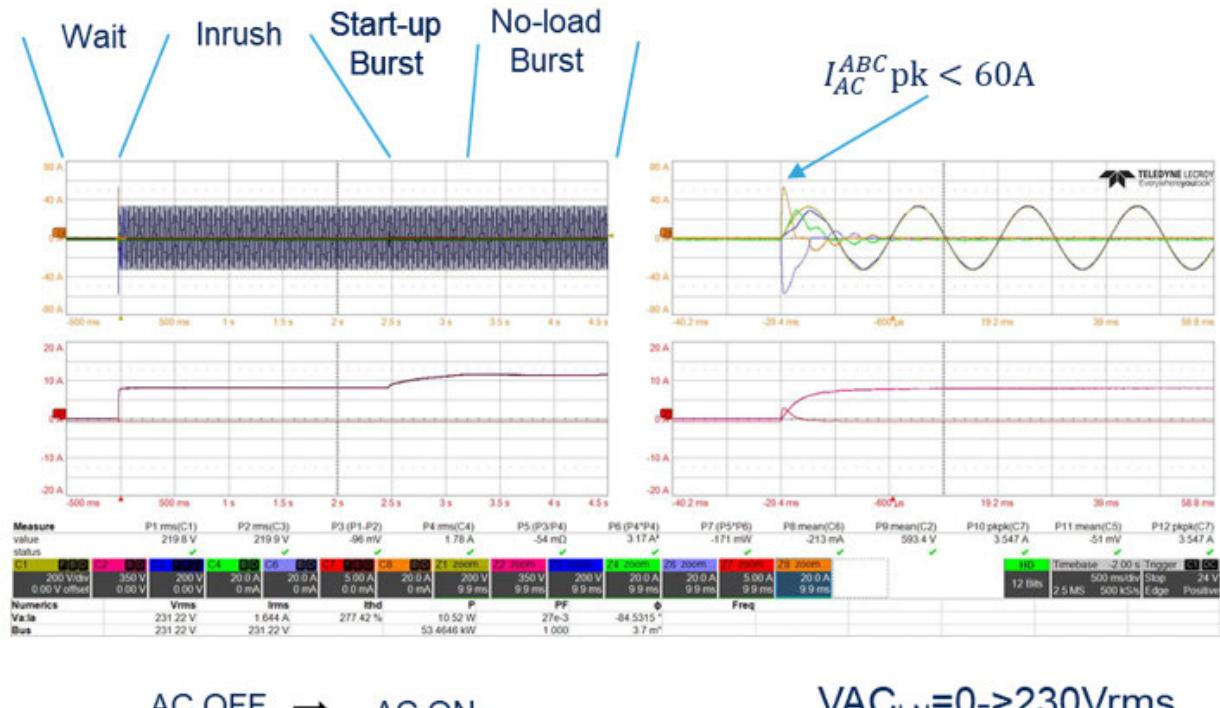

The “DPC\_application\_conf” header file contains the application specific `DEFINE` (that is the ADC gain factor PI regulator gain, FSM configuration, control reference value, etc.).

The “DPC\_Lib\_conf” header file contains the configuration parameters linked to the MCU peripheral configuration.

## 5 Measurements

Item	Q.ty	Ref.	Part / Value	Description	Manufacturer	Order code
1	1	CN56	Jtag_SWD_Adapter	Connector	Samtec	FTSH-105-01-F-D-K
2	26	C1, C3, C5, C6, C7, C10, C28, C34, C36, C37, C45, C48, C49, C51, C52, C53, C55, C59, C61, C62, C65, C66, C134, C137, C138, C139	100nF/16V	CAPACITOR, 603	Any	Any
3	7	C2, C27, C35, C47, C50, C58, C64	1µF/25V	CAPACITOR, 603	Any	Any
4	17	C11, C12, C13, C14, C20, C21, C22, C24, C30, C31, C32, C33, C38, C40, C42, C43, C140	100pF/50V	CAPACITOR, 603	Any	Any
5	3	C15, C23, C135	220nF/50V	CAPACITOR, 603	Any	Any
6	1	C18	470nF/50V	CAPACITOR, 805	Murata	-
7	1	C29	220pF/50V	CAPACITOR, 603	Any	Any
8	1	C133	10µF/25V	CAPACITOR, 805	TDK	-
9	7	D2, D4, D5, D9, D12, D13, D15	GREEN	LED, SMD 0805	Any	Any
10	2	D3, D10	SMAJ5.0A-TR, SMA	400 W TVS in SMA	ST	SMAJ5.0A-TR
11	1	D7	RED	LED, SMD 0805	Any	Any
12	5	F1, F2, F3, F4, F5	30Ω@100MHz	-	TDK Corporation	MPZ2012S300AT000
13	2	JP1, JP7	3JP_pcb	-	-	-
14	1	JP2	STRIP_2X3 (not mounted)	-	-	-
15	1	J1	i2C	CONNECTOR, strip4_100m_v	Any	Any
16	1	J2	CON4	CONNECTOR, strip4_100m_v	Any	Any
17	1	LED1	-	LED	OSRAM	LSG T676
18	1	L1	WE-CBF	FERRITE, 603	WE	74279262
19	1	P1	64 male	Connector	ERNI	533406
20	16	R2, R4, R5, R8, R10, R13, R16, R19, R23, R30, R35, R44, R125, R128, R129, R130	10k	RESISTOR, 603	Any	Any

Item	Q.ty	Ref.	Part / Value	Description	Manufacturer	Order code
21	36	R6, R7, R9, R12, R14, R15, R20, R21, R22, R24, R25, R26, R27, R28, R29, R31, R33, R34, R36, R38, R40, R41, R42, R43, R47, R48, R49, R52, R54, R55, R57, R58, R59, R60, R61, R62	(not mounted)	RESISTOR, 603	Any	Any
22	10	R17, R39, R45, R46, R50, R51, R53, R56, R131, R133	1k	RESISTOR, 603	Any	Any
23	2	R126, R127	0	RESISTOR, 603	Any	Any
24	2	S1, S2	-	None	TE Connectivity	FSM4JSMATR
25	26	TP1, TP2, TP3, TP4, TP5, TP6, TP7, TP8, TP9, TP10, TP11, TP12, TP13, TP14, TP15, TP16, TP17, TP18, TP19, TP20, TP21, TP22, TP24, TP25, TP26, TP27	-	TestPoint, TestPoint	Any	Any
26	1	USB2	-	microUSB connector	MOLEX	47346-0001
27	5	U2, U5, U6, U9, U10	TSV912IDT, SO-8	Wide-bandwidth (8 MHz) rail to rail input/output 5V CMOS Op-Amps, dual	ST	TSV912IDT
28	1	U3	LD29080S33R, SOT-223	800 mA fixed and adjustable output very low drop voltage regulator	ST	LD29080S33R
29	1	U4	STM32G474RET3, LQFP64	Mainstream Arm Cortex-M4 MCU 170 MHz with 512 Kbytes of Flash memory, Math Accelerator, HR Timer, High Analog level integration	ST	STM32G474RET3
30	1	U22	ESDA6V1L, SOT23-3L	Dual Transil array for ESD protection	ST	ESDA6V1L

## Revision history

**Table 10. Document revision history**

Date	Revision	Changes
18-Jan-2022	1	Initial release.

## Contents

<b>1</b>	<b>Getting started</b>	<b>3</b>
<b>1.1</b>	Safety information	3
<b>1.2</b>	Block diagram	3
<b>1.3</b>	Features	3
<b>1.4</b>	Main characteristics	4
<b>1.5</b>	Reference design description	4
<b>1.5.1</b>	Power board	4
<b>1.5.2</b>	Power stage	5
<b>1.5.3</b>	Control board	9
<b>1.6</b>	Power factor correction (PFC) benefits	11
<b>1.7</b>	Converter operation	11
<b>2</b>	<b>How to use the STDES-VRECTFD reference design</b>	<b>12</b>
<b>2.1</b>	System setup	12
<b>2.2</b>	How to connect the reference design	12
<b>2.3</b>	MCU programming and debugging	13
<b>2.3.1</b>	Power supply section	15
<b>2.3.2</b>	Driver section	16
<b>2.4</b>	Preliminary test procedure	16
<b>2.4.1</b>	AC sensing	16
<b>2.4.2</b>	DC sensing	18
<b>2.4.3</b>	AC connection	19
<b>2.4.4</b>	DC connection	19
<b>2.5</b>	Startup procedure	20
<b>2.5.1</b>	Controlled startup procedure	20
<b>2.5.2</b>	Direct startup procedure	24
<b>3</b>	<b>Control</b>	<b>25</b>
<b>3.1</b>	Control strategy	25
<b>3.1.1</b>	Current control strategy	25
<b>3.1.2</b>	Voltage control strategy	27
<b>3.2</b>	Phase locked loop	28
<b>4</b>	<b>Software implementation</b>	<b>29</b>
<b>4.1</b>	Configuration files	30
<b>5</b>	<b>Measurements</b>	<b>32</b>
<b>5.1</b>	Startup procedure	32
<b>5.2</b>	PFC operation	32
