Ultra Low Drop-Out & High Power Supply Rejection Ratio

Power supply stabilization is key for any kind of IC, sensor, module or camera, because sudden load changes and noise can influence the performance of a device. Beyond stable operation, efficiency is very important for power saving and thermal management. A low quiescent current improves long life operation of battery powered systems. Auto discharge, soft-start function over-current protection, inrush current limitation and thermal shutdown are further features to enable an intelligent power supply operation.

Overview of package size

The package options for Toshiba's LDO range from smallest 0.42mm^2 WCSP4F package up to the largest SOT-25. Best thermal performance is achieved using WSCP6F package which requires less than 1mm^2 area. Due to low heights of WCSP and DFN packages, these LDO are particularly suitable for application which require very flat types.

Ultra low drop-out and more

Toshiba's LDO series does not only provide the highest efficiency. It also gives you additional features like high ripple rejection, fast load transient response or low quiescent current to achieve best system performance.

Product lineup for low drop-out regulators

Low drop-out voltage regulators

Series	Output type	Output current	Output voltage	Package	Low drop-out voltage	High ripple rejection	Low inrush current	Fast load transient response	Over-current protection	Thermal shutdown	Auto-discharge

Remove noise from power line

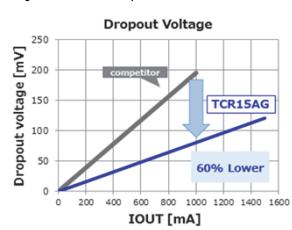

Remove input noise by high PSRR advanced technology.

High output stability at load change

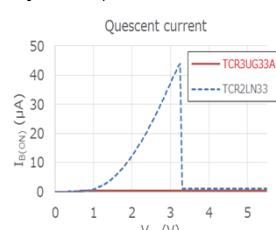

Keeping voltage output stable when load current sudden change.

Low power loss by low dropout

Low input voltage is acceptable by low dropout.

Long battery life operation by low quiescent current

Keeping low IQ by bypass mode.
